

# Categorical methods in linguistics

Robin Piedeleu

2014-10-16

?

## Categories capture composition

## Reconciling syntax and semantics

# Formal, symbolic, logical

*"I reject the contention that an important theoretical difference exists between formal and natural languages."*

- English as a Formal Language, Montague

$$\frac{\frac{\frac{\frac{\frac{\vdash \text{John} : N \quad \frac{y : N \vdash y : N \quad \vdash \text{see} : (S \setminus N) / N}{y : N \vdash \text{see } y : S \setminus N} [/E]}{y : N \vdash \text{John see } y : S} [\setminus E]}{y : N \vdash \text{did John see } y : S \setminus W} [/E]}{x : W \vdash x : W \quad \vdash \text{did} : (S \setminus W) / S} [\setminus E]}{x : W, y : N \vdash x \text{ did John see } y : S} [\setminus E]}{\vdash \text{who did John see} : S} [\circ E]}{\vdash \text{who} : N \circ W} [\circ E]$$

Compositional but incomplete model of meaning.

# Distributional

"You shall know the word by the company it keeps"

- J.R. Firth

Good model of meaning of individual words but not obviously compositional

# Compositional distributional model

- ▶ With categorical methods we wish to provide a general and abstract **interface** between these two approaches.
- ▶ A functor

$$\text{Syntax} \xrightarrow{F} \text{Semantics}$$

- ▶ What structure do we need to express basic syntactic and semantic information? Category in which
  - ▶ objects are grammatical types;
  - ▶ morphisms are ???.

# What structure?

- ▶ **Monoidal:** type of a sentence is the tensor of the types of the words

My fake plants died :  $Pr \otimes Adj \otimes N \otimes V^i$

# What structure?

- ▶ **Monoidal:** type of a sentence is the tensor of the types of the words

My fake plants died :  $Pr \otimes Adj \otimes N \otimes V^i$

- ▶ **Closed:** exponentials equipped with evaluation morphisms\*

$$NP \otimes (NP \Rightarrow S) \xrightarrow{Eval_{NP,S}} S$$

\* satisfying the appropriate universal properties.

# What structure?

- ▶ **Monoidal:** type of a sentence is the tensor of the types of the words

My fake plants died :  $Pr \otimes Adj \otimes N \otimes V^i$

- ▶ **Closed:** exponentials equipped with evaluation morphisms\*

$$(S \leftarrow NP) \otimes NP \xrightarrow{Lave_{NP,S}} S$$

\* satisfying the appropriate universal properties.

# A more convenient framework: compact closed categories

We get a diagrammatic calculus for free!

$$\eta_A^l = \begin{array}{c} A \qquad A \\ \uparrow \qquad \uparrow \\ \text{---} \\ \downarrow \qquad \downarrow \\ A \qquad A \end{array}$$

$$\eta_A^r = \begin{array}{c} A \qquad A \\ \downarrow \qquad \downarrow \\ \text{---} \\ \uparrow \qquad \uparrow \\ A \qquad A \end{array}$$

$$\epsilon_A^l = \begin{array}{c} \text{---} \\ \downarrow \qquad \downarrow \\ A \qquad A \end{array}$$

$$\epsilon_A^r = \begin{array}{c} \text{---} \\ \uparrow \qquad \uparrow \\ A \qquad A \end{array}$$

# A more convenient framework: compact closed categories

We get a diagrammatic calculus for free!

and

# A more convenient framework: compact closed categories

We get a diagrammatic calculus for free!

$$A \otimes (A^r \otimes B) \xrightarrow{\epsilon_A^r \otimes 1_B} B \quad (B \otimes A^l) \otimes A \xrightarrow{1_B \otimes \epsilon_A^l} A$$

The diagram shows two equations. The left equation is  $A \otimes (A^r \otimes B) \xrightarrow{\epsilon_A^r \otimes 1_B} B$ . Below it is a diagram labeled  $Eval_{A,B}$  with two input wires labeled  $A$  at the bottom. The left wire goes up and then curves right to meet the right wire. The right wire goes up and then curves left to meet the left wire. From the intersection, a single wire goes up and is labeled  $B$ . The right equation is  $(B \otimes A^l) \otimes A \xrightarrow{1_B \otimes \epsilon_A^l} A$ . Below it is a diagram labeled  $Lave_{A,B}$  with two input wires labeled  $A$  at the bottom. The left wire goes up and then curves right to meet the right wire. The right wire goes up and then curves left to meet the left wire. From the intersection, a single wire goes up and is labeled  $B$ .

# Reductions

- ▶ Morphisms in the internal language of a monoidal closed category.
- ▶ A reduction looks like

# What structure?

- ▶ **Monoidal:** type of a sentence is the tensor of the types of the words

My fake plants died :  $Pr \otimes Adj \otimes N \otimes V^i$

- ▶ **Closed:** exponentials equipped with evaluation morphisms\*

$$NP \otimes (NP \Rightarrow S) \xrightarrow{Eval_{NP,S}} S$$

# What structure?

- ▶ **Monoidal:** type of a sentence is the tensor of the types of the words

My fake plants died :  $Pr \otimes Adj \otimes N \otimes V^i$

- ▶ **Closed:** exponentials equipped with evaluation morphisms\*

$$NP \otimes (NP \Rightarrow S) \xrightarrow{Eval_{NP,S}} S$$

- ▶ **Dagger:** involutive, identity on object contravariant functor\*. To compare the proximity of meaning:

$$I \xrightarrow{love} N^r \otimes S \otimes N^l \xrightarrow{like^\dagger} I$$

\*satisfying coherence conditions with the compact closed structure.

# Functorial interpretation

Strict monoidal functor from our syntactic category to our semantic category.

## Functorial interpretation

Strict monoidal functor from our syntactic category to our semantic category.

# Functorial interpretation

Strict monoidal functor from our syntactic category to our semantic category.

Examples:

$$Gr \xrightarrow{F} \text{FdHilb},$$

$$\sum_{ijk} \langle John | v_i \rangle s_j \langle v_k | Mary \rangle$$

# Functorial interpretation

Strict monoidal functor from our syntactic category to our semantic category.

Examples:

$$Gr \xrightarrow{F} CPM(\text{FdHilb})$$

Examples:

$$Gr \xrightarrow{F} CPM(\text{FdHilb})$$

$$\text{Tr}_{N,N}(\rho(\text{like}) \circ (\rho(\text{John}) \otimes 1_S \otimes \rho(\text{Mary})))$$

# Disambiguation

Queen

**Context** determines meaning:

- ▶ "the queen overruled the decision of the prime minister"
- ▶ "Queen captures the rook in a1"

# Toy example

Bank

**Context** determines meaning:

"river bank"

## Flow of ambiguity
