## MAYBE

Fast and Simple Relational Processing of Uncertain Data

Lyublena Antova (Cornell), Thomas Jansen (SAP), Christoph Koch (Cornell), Dan Olteanu (Oxford)

## Appl?cati0n Sc nar o: Census data

We want to enter the information from forms like these into a database.

- What is the marital status of the first resp. the second person?
- What are the social security numbers? 185? 186? 785?

## Appl?catiOn Sc ${ }^{\text {e }}$ nar o: Census data

Much of the available information cannot be represented and is lost, e.g.

- Smith's SSN is either 185 or 785; Brown's SSN is either 185 or 186.
- Data cleaning: No two distinct persons can have the same SSN.

## Main goals of the MayBMS project

## Create a scalable DBMS for uncertain/probabilistic data

(1) Representation and storage mechanisms
(2) Uncertainty-aware query and data manipulation language
(3) Efficient processing techniques for queries and constraints

This talk will cover some aspects of (1) and (3).

Representation of uncertain data

## Desiderata for a representation system

(1) Succinctness/Space-efficient storage

- Large number of independent local alternatives, which multiply up to a very large number of worlds.
(2) Efficient real-world query processing
- Tradeoff between succinctness and complexity of query evaluation. We want to do well in practice.
(3) Expressiveness/Representability
- Ability to represent all results of query and constraint processing.
- Constraints/queries enforce dependencies across alternatives!

## Quest for well-behaved representation system (1)

## Properties (ICDE'07, ICDT'07)

- Relational representation of uncertainty at attribute-level
- Complete in the case of finite sets of alternatives (worlds)
- Data independence naturally supported by relational product Decompositions via efficient prime factorization of relations

## Quest for well-behaved representation system (2)

Equivalent column-oriented encoding with one relation per each attribute of $R$.

|  | $w \mapsto 3$ | . 25 |
|  | $w \mapsto 4$ | . 25 |

- Discrete independent (random) variables ( $x, y, v, w$ ).
- Representation: U-relations + table $W$ representing distributions.
- The schema of each U-relation consists of
- a tuple id column,
- a set of column pairs $\left(V_{i}, D_{i}\right)$ representing variable assignments, and
- a set of value columns.

## Semantics of U-Relational Databases

- Each possible world is identified by a valuation $\theta$ that assigns one of the possible values to each variable.
- The probability of the possible world is the product of weights of the values of the variables.
- The value-component of a tuple of a U-relation is in a given possible world if its variable assignments are consistent with $\theta$.
- Attribute-level uncertainty through vertical decomposition.

## Semantics of U-Relational Databases

| $U_{R[S S N]}$ | $\mathrm{V} \mapsto \mathrm{D}$ | TID | SSN |

|  | $w \mapsto 2$ | . 25 |
|  | $w \mapsto 3$ | . 25 |
|  | $w \mapsto 4$ | . 25 |

- We choose possible world $\{x \mapsto 1, y \mapsto 2, v \mapsto 1, w \mapsto 1\}$.

## Semantics of U-Relational Databases

| $U_{R[S S N]}$ | $\mathrm{V} \mapsto \mathrm{D}$ | TID | SSN |
| :--- | :--- | :--- | :--- |
|  | $x \mapsto 1$ | $t_{1}$ | 185 |
|  |  |  |  |
|  | $y \mapsto 2$ | $t_{2}$ | 186 |

$\left.\begin{array}{l|l|l}U_{R[N]} & \mathrm{TID} & \mathrm{N} \\ \hline & t_{1} & \text { Smith } \\ & t_{2} & \text { Brown } \\ W & \mathrm{~V} \mapsto \mathrm{D} & \mathrm{P} \\ \hline \rightarrow & x \mapsto 1 & .4 \\ & x \mapsto 2 & .6 \\ \rightarrow & y \mapsto 1 & .7 \\ \rightarrow & y \mapsto 2 & .3 \\ \rightarrow & v \mapsto 1 & .8 \\ & v \mapsto 2 & .2 \\ & w \mapsto 1 & .25 \\ & w \mapsto 2 & .25 \\ & w \mapsto 3 & .25 \\ & w & w\end{array}\right) .25$

- We choose possible world $\{x \mapsto 1, y \mapsto 2, v \mapsto 1, w \mapsto 1\}$.
- Probability weight of this world: . $4^{*} .3^{*} .8^{*} .25=.024$.
- Now we have a vertically decomposed version of the chosen possible world.

## Properties of U-Relational Databases

- Complete representation system for finite sets of possible worlds
- MystiQ: independent tuples/block-independent disjoint tables
- Often exponentially more succinct than WSDs, ULDBs, prob. databases
- A special case of c-tables
- like all other existing representation formalisms, BUT...
- Purely relational representation of uncertainty at attribute-level
- in contrast to probabilistic databases of MystiQ and ULDBs of Trio
- Efficient relational evaluation of many query operators (next topic)

## Efficient query evaluation

## Positive relational algebra

Query evaluation under possible world semantics:

For any positive relational algebra query $q$ over any U-relational database $T$, there exists a positive relational algebra query $\bar{q}$ of polynomial size such that

$$
\bar{q}(T)=\operatorname{rep}^{-1}\left(\left\{q\left(\mathcal{A}_{i}\right) \mid \mathcal{A}_{i} \in \operatorname{rep}(T)\right\}\right)
$$

Properties

- relational evaluation using the query plan of your choice
- PTIME data complexity
- preserves the provenance of answer tuples

## Query Evaluation: Example

Names of possibly married persons: possible $\left(\pi_{\text {Name }}\left(\sigma_{\text {Status }}=2(S)\right)\right)$

Evaluation steps:
(1) merge the U-relations storing the necessary columns:
$Q:=\operatorname{possible}\left(\pi_{\text {Name }}\left(\sigma_{\text {Status }=2}\left(\operatorname{merge}\left(\pi_{\text {Name }}(S), \pi_{\text {Status }}(S)\right)\right)\right)\right)$

## Query Evaluation: Example

Names of possibly married persons: possible $\left(\pi_{\text {Name }}\left(\sigma_{\text {Status }}=2(S)\right)\right.$ )

| $U_{\text {S[Name] }}$ | $\mathrm{V} \mapsto \mathrm{D}$ | TID | Name | $U_{S[\text { Status] }}$ | $\frac{V \mapsto D}{x_{3} \mapsto 1}$ | $\frac{\text { TID }}{t_{1}}$ | $\frac{\text { Status }}{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |
|  | $x_{3} \mapsto 1$ | $t_{1}$ | Smith |  | $x_{3} \mapsto 2$ | $t_{1}$ | 2 |
|  | $x_{5} \mapsto 1$ | $t_{2}$ | Brown |  | $x_{6} \mapsto 1$ | $t_{2}$ | 1 |
|  |  |  |  |  | $x_{6} \mapsto 2$ | $t_{2}$ | 2 |

Evaluation steps:
(1) merge the U-relations storing the necessary columns:
$Q:=\operatorname{possible}\left(\pi_{\text {Name }}\left(\sigma_{\text {Status }=2}\left(\right.\right.\right.$ merge $\left.\left.\left.\left(\pi_{\text {Name }}(S), \pi_{\text {Status }}(S)\right)\right)\right)\right)$
(3) rewrite $Q$ on column-store:
$P:=\pi_{\text {Name }}\left(\sigma_{\text {Status }=2}\left(U_{S[\text { Name }]} \bowtie_{\psi \wedge \phi} U_{S[\text { Status }]}\right)\right)$, where
$\psi$ ensures that we only generate tuples that occur in some worlds:
$\psi:=\left(U_{S[\text { Name }]} \cdot V=U_{S[S t a t u s]} \cdot V \Rightarrow U_{S\left[N_{\text {ame }}\right]} \cdot D=U_{S[\text { Status }]} \cdot D\right)$,
$\phi$ ensures that we only merge valid tuples:
$\phi:=\left(U_{S[\text { Name }]} \cdot T I D=U_{S[S t a t u s]} . T I D\right)$

## Query Evaluation: Example

Names of possibly married persons: possible $\left(\pi_{\text {Name }}\left(\sigma_{\text {Status }=2}(S)\right)\right)$

| $U_{\text {S[Name] }}$ | $\mathrm{V} \mapsto \mathrm{D}$ | TID | Name | $U_{S[\text { Status] }}$ | $\frac{V \mapsto D}{x_{3} \mapsto 1}$ | $\frac{\text { TID }}{t_{1}}$ | $\frac{\text { Status }}{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |
|  | $x_{3} \mapsto 1$ | $t_{1}$ | Smith |  | $x_{3} \mapsto 2$ | $t_{1}$ | 2 |
|  | $x_{5} \mapsto 1$ | $t_{2}$ | Brown |  | $x_{6} \mapsto 1$ | $t_{2}$ | 1 |
|  |  |  |  |  | $x_{6} \mapsto 2$ | $t_{2}$ | 2 |

Evaluation steps:
(1) merge the U-relations storing the necessary columns:
$Q:=\operatorname{possible}\left(\pi_{\text {Name }}\left(\sigma_{\text {Status }=2}\left(\right.\right.\right.$ merge $\left.\left.\left.\left(\pi_{\text {Name }}(S), \pi_{\text {Status }}(S)\right)\right)\right)\right)$
(3) rewrite $Q$ on column-store:
$P:=\pi_{\text {Name }}\left(\sigma_{\text {Status }=2}\left(U_{S[\text { Name }]} \bowtie_{\psi \wedge \phi} U_{S[\text { Status }]}\right)\right)$, where
$\psi$ ensures that we only generate tuples that occur in some worlds:
$\psi:=\left(U_{S[\text { Name }]} \cdot V=U_{S[S t a t u s]} \cdot V \Rightarrow U_{S\left[N_{\text {ame }}\right]} \cdot D=U_{S[\text { Status }]} \cdot D\right)$,
$\phi$ ensures that we only merge valid tuples:
$\phi:=\left(U_{S[\text { Name }]} \cdot T I D=U_{S[S t a t u s]}\right.$. TID $)$
(3) feed $P$ to any relational query optimizer

## Beyond positive relational algebra

## Difference

Tuple q-possibility is NP-hard even for normalized tuple-level U-relations and queries with difference. BUT this is already true for Codd tables.

World-set Algebra [SIGMOD'07,VLDB'07]

- Possible (R)

Implemented using projection

- Certain (R)

Implemented using division for normalized tuple-level U-relations (normalization $=$ at most one variable assignment per tuple)

- repair-key ${ }_{\vec{A}[@ P]}(R)$

Turns a possible world into the set of worlds consisting of all possible maximal repairs of key $\vec{A}$ in $R$.

- conf (R)

Computes the exact confidence of (distinct) tuples

- ...

## repair-key example

Tossing a biased coin twice.

| $R$ | Toss | Face | FProb |  |
| :--- | :---: | :---: | :---: | :--- |
|  | 1 | H | .4 |  |
|  | 1 | T | .6 | $\operatorname{Pr}=1$ |
|  | 2 | H | .4 |  |
|  | 2 | T | .6 |  |

$S:=$ repair-key $_{\text {TossefProb }}(R) \quad$ results in four worlds:

| $S^{1}$ | Toss | Face | FProb |  | $S^{2}$ | Toss | Face | FProb |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | H | .4 |  |  | 1 | H | .4 |
|  | 2 | H | .4 |  |  | 2 | T | .6 |
|  |  |  |  |  |  |  |  |  |
| $S^{3}$ | Toss | Face | FProb |  | $S^{4}$ | Toss | Face | FProb |
|  | 1 | T | .6 |  |  |  |  |  |
|  | 2 | H | .4 |  |  | 1 | T | .6 |
|  |  |  |  |  |  | T | .6 |  |

$$
\operatorname{Pr}\left(S^{1}\right)=1 \cdot \frac{.4}{.4+.6} \cdot \frac{.4}{.4+.6}=.16, \quad \operatorname{Pr}\left(S^{2}\right)=\operatorname{Pr}\left(S^{3}\right)=.24, \operatorname{Pr}\left(S^{4}\right)=.36
$$

## repair-key example

Tossing a biased coin twice.

| $R$ | Toss | Face | FProb |  |
| :--- | :---: | :---: | :---: | :--- |
|  | 1 | H | .4 |  |
|  | 1 | T | .6 | $\operatorname{Pr}=1$ |
|  | 2 | H | .4 |  |
|  | 2 | T | .6 |  |

$S:=$ repair-key $_{\text {Toss@FProb }}(R) \quad$ is just a projection/copying of columns (even though we may create an exponential number of possible worlds)!

| $U_{S}$ | $\mathrm{~V} \mapsto \mathrm{D}$ | Toss | Face | FProb |
| :---: | :---: | :---: | :---: | :---: |
|  | $1 \mapsto \mathrm{H}$ | 1 | H | .4 |
|  | $1 \mapsto \mathrm{~T}$ | 1 | T | .6 |
|  | $2 \mapsto \mathrm{H}$ | 2 | H | .4 |
|  | $2 \mapsto \mathrm{~T}$ | 2 | T | .6 |

| $W$ | $\mathrm{~V} \mapsto \mathrm{D}$ | P |
| :--- | :--- | :--- |
|  | $1 \mapsto \mathrm{H}$ | .4 |
|  | $1 \mapsto \mathrm{~T}$ | .6 |
|  | $2 \mapsto \mathrm{H}$ | .4 |
|  | $2 \mapsto \mathrm{~T}$ | .6 |

## What about probabilities?

Given a tuple $t$ with a set of valuations $S$, compute $\operatorname{conf}(t)$ by partitioning $S$
(a) into independent subsets (exploit contextual independence)
(b) by removing variables (modified Davis-Putnam)
(c) by removing valuations (compute equiv. set of pairwise mutex valuations) Our current approach is a cost-based interplay of (a)-(c).

More in Conditioning Probabilistic Databases by Koch\&Olteanu.

## Confidence computation example

$$
S=\{\{x \mapsto 1\},\{x \mapsto 2, y \mapsto 1\},\{x \mapsto 2, z \mapsto 1\},\{u \mapsto 1, v \mapsto 1\},\{u \mapsto 2\}\}
$$

## Confidence computation example

$$

## Experiments

## Uncertain data generator

- extend TPC-H population generator 2.6 to generate U-relational databases any generated world has the sizes of relations and join selectivities of the original TPC-H one-world case
- parameters: scale (s), uncertainty ratio (x), correlation ratio (z), max alternatives per field (8), drop after correlation (0.25)
- correlations follow a pattern obtained by chasing egds on uncertain data [ICDE'07]

## Uncertainty and storage

Total number of worlds, max. number of domain values for a variable (Rng), and size in MB of the U-relational database for each of our settings.

- exponentially more succinct than representing worlds individually
- $10^{8 \cdot 10^{6}}$ worlds need $13 \mathrm{GBs} \approx 8$ times the size of one world ( 1.4 GBs )
- case $x=0$ is the DB generated by the original TPC-H (without uncertainty)

## Evaluation of positive relational algebra queries

$Q_{1}$ : possible (select o.orderkey, o.orderdate, o.shippriority from customer c, orders o, lineitem I where c.mktsegment $=$ 'BUILDING' and c.custkey $=0$. custkey and o.orderkey $=$ I.orderkey and o.orderdate > '1995-03-15' and I.shipdate $<$ '1995-03-17')

Query 1 z 0.1

Query 1 z 0.5

- uncertainty varies from 0.001 to $0.1 \rightarrow$ evaluation time up to 6 times slower
- correlation varies from 0.1 to $0.5 \rightarrow$ evaluation time up to 3 times slower
- scale varies from 0.01 to $1 \rightarrow$ evaluation time up to 400 times slower scale $=1$ : the answer size ranges from tens of thousands to tens of millions.

## Attribute-level vs. tuple-level

SPJ query on six relations represented by equivalent

- attribute-level U-relational databases
- tuple-level U-relational databases
- Trio's ULDBs (are tuple-level only)

Skipped the exponential time task of removing erroneous tuples
Query 3 z 0.1

- Experiment only possible for small scenarios:
$1 \%$ uncertainty, lowest correlation factor 0.1, and scale up to 0.1 .
- an increase in any of our parameters would create prohibitively large (exponential in the arity of relations) tuple-level representations.

## Experiments: Confidence computation

Excellent behaviour (within seconds) for

- few variables (100), many ws-descriptors (5K - 50K)
- many variables (100K), few ws-descriptors (01.K - 5K)

Heuristics for variable elimination: good variable choices are extremely valuable even if they require polynomial time
Competitive even when compared with Monte Carlo simulation based on Karp-Luby FPRAS (fully polynomial randomized approx. scheme) for \#DNF.

KL versus INDVE ( 50 variables, $r=2, s=4$ )

Karp-Luby (KL): with at least $90 \%$ probability, the estimated error is within $1 \%$, and $10 \%$ resp., from the exact value.

## Query evaluation: Example 2

Violated SSN keys: possible $\left(\pi_{r_{1}} . S S N\left(\left(R r_{1}\right) \bowtie_{r_{1} . S S N=r_{2} . S S N \wedge r_{1} . N<>r_{2} . N}\left(R r_{2}\right)\right)\right)$

| $U_{S[S S N]}$ | $\mathrm{V} \mapsto \mathrm{D}$ | TID | SSN |
| :--- | :---: | :---: | :---: |
|  | $x_{1} \mapsto 1$ | $t_{1}$ | 185 |
|  | $x_{1} \mapsto 2$ | $t_{1}$ | 785 |
|  | $x_{4} \mapsto 1$ | $t_{2}$ | 185 |
|  | $x_{4} \mapsto 2$ | $t_{2}$ | 186 |

| $U_{\text {S[Name] }}$ | $\mathrm{V} \mapsto \mathrm{D}$ | TID | Name |
| :--- | :--- | :---: | :---: |
|  | $x_{2} \mapsto 1$ | $t_{1}$ | Smith |
|  | $x_{5} \mapsto 1$ | $t_{2}$ | Brown |

Rewritten query on column-store:
$S:=U_{S[S S N]} \bowtie_{\psi \wedge \phi} U_{S[\text { Name }]}$
$P:=\pi_{s_{1} . S S N}$ as $\operatorname{SSN}\left(\left(S s_{1}\right) \bowtie_{s_{1} . S S N=s_{2} . S S N \wedge s_{1} . N a m e<>s_{2} . N a m e}\left(S s_{2}\right)\right)$

| $P$ | $\mathrm{~V}_{1} \mapsto \mathrm{D}_{1}$ | $\mathrm{~V}_{2} \mapsto \mathrm{D}_{2}$ | $\mathrm{~V}_{3} \mapsto \mathrm{D}_{3}$ | $\mathrm{~V}_{4} \mapsto \mathrm{D}_{4}$ | $T_{s_{1}}$ | $T_{s_{2}}$ | $S S N$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $x_{1} \mapsto 1$ | $x_{2} \mapsto 1$ | $x_{4} \mapsto 1$ | $x_{5} \mapsto 1$ | $t_{1}$ | $t_{2}$ | 185 |
|  | $x_{5} \mapsto 1$ | $x_{4} \mapsto 1$ | $x_{1} \mapsto 1$ | $x_{2} \mapsto 1$ | $t_{2}$ | $t_{1}$ | 185 |

## Uncertainty-aware query language

## Desiderata for a Query Language for Uncertain Data

- genericity - declarative queries, independent from representation details
- Trio's TriQL is not generic
- ability to transform data
- beyond the filtering of world-sets as in MystiQ
- ability to introduce additional uncertainty (!!!)
- To make it a natural query language for the possible worlds model: compositionality
- Decision support queries/hypothetical queries
- Probabilistic databases: extending the hypothesis space to use evidence
- right degree of expressive power - not too strong and not too weak
- efficient query evaluation

## World-set Algebra

- The operations of relational algebra.
- Evaluated individually, in "parallel" in all possible worlds.
- An operation $\operatorname{conf}(R)$ for computing tuple confidence values.
- Computes, for each tuple that occurs in $R$ in at least one world, the sum of the probabilities of the worlds in which it occurs.
- An operation $\operatorname{assert}_{\phi}(R)$ that conditions the database using a constraint $\phi$.
- Removes those worlds that violate $\phi$.
- An operation repair-key $\vec{A}[@ P](R)$ for introducing uncertainty.
- Turns a possible world into the set of worlds consisting of all possible maximal repairs of key $\vec{A}$ in $R$.
- We will also look at a special case of repair-key called choice-of.
- An operation for grouping worlds based on common properties
- property = answer to a given query
- (we will not discuss this one here)

## Operation choice-of

- Introducing uncertainty using the choice-of operation allows to extend the hypothesis space.

$$
\begin{array}{l|ccc}
R^{1} & \mathrm{~A} & \mathrm{~B} & \mathrm{C} \\
\hline & \mathrm{a} & 1 & \mathrm{c} \\
& \mathrm{a} & 1 & \mathrm{~d}
\end{array} \operatorname{Pr}=.5 \quad \ldots \text { (further worlds) }
$$

$S:=$ choice-of $_{A \varrho B}(R)$

| $S^{1.1}$ | A | B | C |
| :--- | :---: | :---: | :---: |
|  | a | 1 | c |
|  | a | 1 | d |

$$
\operatorname{Pr}=.5 * 1 / 4=1 / 8
$$

$$
\operatorname{Pr}=.5 * 3 / 4=3 / 8
$$

There must be a functional dependency $R: A \rightarrow B$.

- Necessary if we want to introduce evidence.

## Operation repair-key

Example: Tossing a biased coin twice.

| $R$ | Toss | Face | FProb |  |
| :--- | :---: | :---: | :---: | :--- |
|  | 1 | H | .4 |  |
|  | 1 | T | .6 | $\operatorname{Pr}=1$ |
|  | 2 | H | .4 |  |
|  | 2 | T | .6 |  |

$S:=$ repair-key $_{\text {Toss@FProb }}(R) \quad$ results in four worlds:

| $S^{1}$ | Toss | Face | FProb |  | $S^{2}$ | Toss | Face | FProb |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | H | .4 |  |  | 1 | H | .4 |
|  | 2 | H | .4 |  |  | 2 | T | .6 |
|  |  |  |  |  |  |  |  |  |
| $S^{3}$ | Toss | Face | FProb |  | $S^{4}$ | Toss | Face | FProb |
|  | 1 | T | .6 |  |  |  |  |  |
|  | 2 | H | .4 |  |  | 1 | T | .6 |
|  |  |  |  |  |  | T | .6 |  |

$$
\operatorname{Pr}\left(S^{1}\right)=1 \cdot \frac{.4}{.4+.6} \cdot \frac{.4}{.4+.6}=.16, \quad \operatorname{Pr}\left(S^{2}\right)=\operatorname{Pr}\left(S^{3}\right)=.24, \operatorname{Pr}\left(S^{4}\right)=.36
$$

## Operation conf

$\operatorname{conf}(R)$ gives the probability of each tuple across all worlds:

| $\operatorname{conf}(R)$ | $x$ | $z$ | $P$ |
| :--- | :--- | :--- | :--- |
|  | a | b | .5 |
|  | a | c | .5 |
|  | b | c | .3 |
|  | c | d | .7 |

For a Boolean query $Q$ and a world-set $\mathbf{W}, \operatorname{conf}(Q)$ gives us one number, the probability of the event $\{I \in \mathbf{W} \mid I \vDash Q\}$, which is the confidence of tuple $\rangle$.

## Conditioning using assert

Example: enforcing a key constraint on SSN.

| $U_{R[S S N]}$ | V | D | TID | SSN |
| :--- | :--- | :--- | :--- | :--- |
|  | $x$ | 1 | $t_{1}$ | 185 |
|  | $x$ | 2 | $t_{1}$ | 785 |
|  | $y$ | 1 | $t_{2}$ | 185 |
|  | $y$ | 2 | $t_{2}$ | 186 |

$T:=\operatorname{assert}_{f d: S S N \rightarrow T I D}(R)$.
We drop the worlds where both tuples $t_{1}$ and $t_{2}$ occur with $\mathrm{SSN}=185$.

| $U_{T[S S N]}$ | $V_{1}$ | $D_{1}$ | $V_{2}$ | $D_{2}$ | TID | SSN |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | $x$ | 1 | $y$ | 2 | $t_{1}$ | 185 |
|  | $x$ | 1 | $y$ | 2 | $t_{2}$ | 186 |
|  | $x$ | 2 | $y$ | 1 | $t_{1}$ | 785 |
|  | $x$ | 2 | $y$ | 1 | $t_{2}$ | 185 |
|  | $x$ | 2 | $y$ | 2 | $t_{1}$ | 785 |
|  | $x$ | 2 | $y$ | 2 | $t_{2}$ | 186 |
