Greedy algorithm

Strong map $f : M \rightarrow N$:

- preimage of a closed set is closed
- $r(f(Y)) - r(f(X)) \leq r(Y) - r(X)$ for all $X \subseteq Y \subseteq E(M)$
- $L(f) : L(M) \rightarrow L(N)$ preserves joins and sends atoms to atoms or bottom

Greedy algorithm

Greedy algorithm

Every run of the greedy algorithm produces a maximal chain of epimorphisms in a subcategory of $\mathbf{Vect}_{\mathbb{R}}^b$. The greedy algorithm solves the optimization problem if and only if the chains in $\mathbf{Vect}_{\mathbb{R}}^b$ induced by all runs have the same limit.
