

Quantum Processes and Computation

Assignment 2, Friday, 22 Oct, 17:00

Deadline: Week 3 (group 1) or week 4 (groups 2-6)

Goals: After completing these exercises you should know how to reason with the transpose, adjoints, and the conjugate, and work with projections, unitaries and isometries. Material covered in book: Chapter 4.

Note: Many of these exercises also appear in *Picturing Quantum Processes*, but sometimes they have been slightly modified for the problem sheet. The corresponding exercise number from the book is shown in brackets.

Exercise 1 (4.10 & 4.16):

(a) Prove that in **relations**, the following relations on a set A :

$$\cup :: * \mapsto \{(a, a) \mid a \in A\} \quad \cap :: \forall a \in A : (a, a) \mapsto *$$

satisfy the *yanking equations* (eq. 4.11 in the book), and thus that **relations** has process-state duality.

(b) Show that process-state duality does not hold for **functions**.

Exercise 2 (4.12): Prove that

$$\text{loop} = \text{line} \quad \text{or written differently: } \begin{array}{c} \triangle \\ \cap \\ \text{---} \\ \cup \\ \triangle \end{array} = \text{line}$$

follows from the following 3 equations:

$$\text{cup} = \text{line} = \text{uncup} \quad \text{cross} = \text{cup} \quad \text{loop} = \text{cap}$$

Hint: Use the second notation (with the boxes) as it prevents you from accidentally cheating.

Exercise 3 (4.14 in online version of PQP): Show that the following are equivalent:

(i) a state and an effect satisfying:

$$\begin{array}{c} \triangle \\ \cap \\ \text{---} \\ \cup \\ \triangle \end{array} = \text{line} \quad \begin{array}{c} \text{---} \\ \cap \\ \cup \\ \text{---} \end{array} = \begin{array}{c} \text{---} \\ \cup \\ \text{---} \end{array}$$

(ii) a state and an effect satisfying:

$$\begin{array}{c} \text{---} \\ \cup \\ \triangle \\ \cap \\ \text{---} \end{array} = \text{line} \quad \begin{array}{c} \triangle \\ \cap \\ \text{---} \\ \cup \\ \text{---} \end{array} = \begin{array}{c} \triangle \\ \cap \\ \text{---} \\ \cup \\ \text{---} \end{array}$$

So in particular, if either eqs. (i) or eqs. (ii) hold, then all equations hold.

Exercise 4 (4.59): An *inverse* for a process $f : A \rightarrow B$ is a process $f^{-1} : B \rightarrow A$ such that $f^{-1} \circ f = \text{id}_A$ and $f \circ f^{-1} = \text{id}_B$. Show that for a process f the following are equivalent:

- f is unitary.
- f is an isometry and has an inverse.
- f^\dagger is an isometry and has an inverse.

Exercise 5 (4.37): Show that the trace of a process is independent of the particular choice of cup and cap, i.e. that if \cup and \cap satisfy the yanking equations, but \cup' and \cap' also satisfy it that then:

For a process $f : A \rightarrow A$ we define its *separable projector* by

Exercise 6 (4.73): Given processes $f_i : A \rightarrow A$ find the process g such that:

Write g as a sequential composition of the conjugates, transposes and adjoints of the f_i 's.

Hint: Doing exercise 4.73 from the book first might reveal whether you understand the concept.

Exercise 7 (4.82): A state ψ is *maximally non-separable* if it corresponds to a unitary U by process-state duality, up to a number:

Show (i) that if one applies a unitary V to one side of a maximally non-separable state:

that one again obtains a maximally non-separable state, and (ii) that this unitary can always be chosen such that the resulting state is the cup (up to a number).
