Quantum Recursion and Second Quantisation Basic Ideas and Examples

Mingsheng Ying

University of Technology, Sydney, Australia and Tsinghua University, China

Happy Birthday Prakash!

Happy Birthday Prakash!

I'm very grateful to Prakash for teaching me second quantisation method during his visit to UTS in 2013

Classical Recursion of Quantum Programs

 Recursive procedure in quantum programming language QPL [Selinger, Mathematical Structures in Computer Science'2004].

Classical Recursion of Quantum Programs

- Recursive procedure in quantum programming language QPL [Selinger, Mathematical Structures in Computer Science'2004].
- Termination of quantum while-loops in finite-dimensional state spaces [Ying, Feng, *Acta Informatica*'2010].

- ロト・ 日本・ モー・ モー・ うらく

Classical Recursion of Quantum Programs

- Recursive procedure in quantum programming language QPL [Selinger, Mathematical Structures in Computer Science'2004].
- Termination of quantum while-loops in finite-dimensional state spaces [Ying, Feng, *Acta Informatica*'2010].
- Selinger's slogan: Quantum data, classical control control flow of the quantum recursions is classical because branchings are determined by the outcomes of certain quantum measurements.

Quantum Control Flow

Quantum programming language QML [Altenkirch and Grattage, *LICS*'2005]:

Two case constructs in the quantum setting:

 case, measure a qubit in the data it analyses - The control flow is determined by the outcome of a measurement and thus is classical.

Quantum Control Flow

Quantum programming language QML [Altenkirch and Grattage, *LICS*'2005]:

Two case constructs in the quantum setting:

 case, measure a qubit in the data it analyses - The control flow is determined by the outcome of a measurement and thus is classical.

1. Introduction

2. Quantum Case Statement and Quantum Choice

3. Motivating Example: Recursive Quantum Walks

4. Second Quantisation

5. Semantics of Quantum Recursion

7. Conclusion

"Coined" Quantum Case Statement

• Introduce an <u>external</u> "quantum coin" *c*: The state Hilbert space $\mathcal{H}_c = \text{span}\{|0\rangle, |1\rangle\}$

▲□▶ ▲圖▶ ▲ 国▶ ▲ 国▶ - 国 - のへで

"Coined" Quantum Case Statement

- ► Introduce an <u>external</u> "quantum coin" *c*: The state Hilbert space $\mathcal{H}_c = \text{span}\{|0\rangle, |1\rangle\}$
- ► U₀ and U₁ two unitary transformations on a quantum system q the state Hilbert space H_q.

"Coined" Quantum Case Statement

- ► Introduce an <u>external</u> "quantum coin" *c*: The state Hilbert space $\mathcal{H}_c = \text{span}\{|0\rangle, |1\rangle\}$
- ► U₀ and U₁ two unitary transformations on a quantum system q the state Hilbert space H_q.
- A quantum case statement employing "quantum coin" c:

```
\begin{array}{l} \textbf{qif} \left[ c \right] \left| 0 \right\rangle \to U_0[q] \\ \\ \Box \left| 1 \right\rangle \to U_1[q] \end{array} fiq
```

"coined" Quantum Case Statement

► The semantics is an unitary operator U in H_c ⊗ H_q - the state Hilbert space of the composed system of "coin" c and principal system q:

$$U|0,\psi
angle=|0
angle U_0|\psi
angle, \quad U|1,\psi
angle=|1
angle U_1|\psi
angle$$

"coined" Quantum Case Statement

► The semantics is an unitary operator U in H_c ⊗ H_q - the state Hilbert space of the composed system of "coin" c and principal system q:

$$U|0,\psi
angle=|0
angle U_0|\psi
angle, \quad U|1,\psi
angle=|1
angle U_1|\psi
angle$$

Matrix representation:

$$U = |0\rangle\langle 0|\otimes U_0 + |1\rangle\langle 1|\otimes U_1 = \left(egin{array}{cc} U_0 & 0 \ 0 & U_1 \end{array}
ight).$$

Quantum Choice

• *V* a unitary operator in the state Hilbert space \mathcal{H}_c of the "coin".

Quantum Choice

- *V* a unitary operator in the state Hilbert space \mathcal{H}_c of the "coin".
- The quantum choice of $U_0[q]$ and $U_1[q]$ with "coin-tossing" V[c]:

```
\begin{array}{l} U_0[q] \oplus_{V[c]} U_1[q] \\ \stackrel{\text{def}}{=} \\ V[c]; \ \mathbf{qif} \ [c] \ |0\rangle \to U_0[q] \\ & \Box \ |1\rangle \to U_1[q] \\ & \mathbf{fiq} \end{array}
```

Quantum Choice

- *V* a unitary operator in the state Hilbert space \mathcal{H}_c of the "coin".
- The quantum choice of $U_0[q]$ and $U_1[q]$ with "coin-tossing" V[c]:

```
U_0[q] \oplus_{V[c]} U_1[q]
\stackrel{\text{def}}{=}
V[c]; \operatorname{qif} [c] |0\rangle \to U_0[q]
\Box |1\rangle \to U_1[q]
fiq
```

 Compare with probabilistic choice [McIver and Morgan, Abstraction, Refinement and Proof for Probabilistic Systems, 2005]

External "Quantum Coin"

 Superpositions of time evolutions of a quantum system [Aharonov, Anandan, Popescu, Vaidman, *Plysical Review Letters* 1990].

Example - One-dimensional quantum walk

 One-dimensional random walk - a particle moves on a line marked by integers Z; at each step it moves one position left or right, depending on the flip of a fair coin.

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

 Hadamard walk - a quantum variant of one-dimensional random walk.

Example - One-dimensional quantum walk

 One-dimensional random walk - a particle moves on a line marked by integers Z; at each step it moves one position left or right, depending on the flip of a fair coin.

- Hadamard walk a quantum variant of one-dimensional random walk.
- Its state Hilbert space $\mathcal{H}_d \otimes \mathcal{H}_p$:

Example - One-dimensional quantum walk

- One-dimensional random walk a particle moves on a line marked by integers Z; at each step it moves one position left or right, depending on the flip of a fair coin.
- Hadamard walk a quantum variant of one-dimensional random walk.
- Its state Hilbert space $\mathcal{H}_d \otimes \mathcal{H}_p$:
 - $\mathcal{H}_d = \text{span}\{|L\rangle, |R\rangle\}$, *L*, *R* indicate the direction Left and Right.

Example - One-dimensional quantum walk

- One-dimensional random walk a particle moves on a line marked by integers Z; at each step it moves one position left or right, depending on the flip of a fair coin.
- Hadamard walk a quantum variant of one-dimensional random walk.
- Its state Hilbert space $\mathcal{H}_d \otimes \mathcal{H}_p$:
 - $\mathcal{H}_d = \text{span}\{|L\rangle, |R\rangle\}$, *L*, *R* indicate the direction Left and Right.
 - $\mathcal{H}_p = \operatorname{span}\{|n\rangle : n \in Z\}, n \text{ indicates the position marked by integer } n.$

• One step of Hadamard walk — $W = T(H \otimes I)$:

- One step of Hadamard walk $W = T(H \otimes I)$:
 - Translation T:

$$T|L,n\rangle = |L,n-1\rangle, \quad T|R,n\rangle = |R,n+1\rangle$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

is unitary operator in $\mathcal{H}_d \otimes \mathcal{H}_p$.

- One step of Hadamard walk $W = T(H \otimes I)$:
 - Translation T:

•

$$T|L,n\rangle = |L,n-1\rangle, \quad T|R,n\rangle = |R,n+1\rangle$$

is unitary operator in $\mathcal{H}_d \otimes \mathcal{H}_p$.

$$H = \frac{1}{\sqrt{2}} \left(\begin{array}{cc} 1 & 1\\ 1 & -1 \end{array} \right)$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

is Hadamard transform in the direction space \mathcal{H}_d

• Define the left and right translation operators T_L and T_R in the position space \mathcal{H}_p :

$$T_L|n\rangle = |n-1\rangle, \quad T_R|n\rangle = |n+1\rangle$$

• Define the left and right translation operators T_L and T_R in the position space \mathcal{H}_p :

$$T_L|n\rangle = |n-1\rangle, \quad T_R|n\rangle = |n+1\rangle$$

▶ Then the translation operator *T* is a quantum case statement:

$$T = \mathbf{qif} [d] |L\rangle \to T_L[p]$$

 $\Box |R\rangle \to T_R[p]$
fiq

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

• Define the left and right translation operators T_L and T_R in the position space \mathcal{H}_p :

$$T_L|n\rangle = |n-1\rangle, \quad T_R|n\rangle = |n+1\rangle$$

▶ Then the translation operator *T* is a quantum case statement:

$$T = \mathbf{qif} [d] |L\rangle \to T_L[p]$$

 $\Box |R\rangle \to T_R[p]$
fiq

• The single-step walk operator *W* is a quantum choice:

$$T_L[p] \oplus_{H[d]} T_R[p]$$
Example - One-dimensional quantum walk

▶ Define the left and right translation operators *T*_L and *T*_R in the position space *H*_p :

$$T_L|n\rangle = |n-1\rangle, \quad T_R|n\rangle = |n+1\rangle$$

▶ Then the translation operator *T* is a quantum case statement:

$$T = \mathbf{qif} [d] |L\rangle \to T_L[p]$$

 $\Box |R\rangle \to T_R[p]$
fiq

• The single-step walk operator *W* is a quantum choice:

$$T_L[p] \oplus_{H[d]} T_R[p]$$

Hadamard walk — repeated applications of operator W.

The walk first runs the "coin-tossing" Hadamard operator H[d], and then a quantum case statement:

- The walk first runs the "coin-tossing" Hadamard operator H[d], and then a quantum case statement:
 - if the "direction coin" *d* is in state |*L*⟩ then the walker moves one position left;

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

- The walk first runs the "coin-tossing" Hadamard operator H[d], and then a quantum case statement:
 - ▶ if the "direction coin" *d* is in state |*L*⟩ then the walker moves one position left;
 - if *d* is in state |*R*⟩ then it moves one position right, followed by a procedure *behaving as the recursive walk itself*.

- The walk first runs the "coin-tossing" Hadamard operator H[d], and then a quantum case statement:
 - if the "direction coin" *d* is in state |*L*⟩ then the walker moves one position left;
 - if *d* is in state |*R*⟩ then it moves one position right, followed by a procedure *behaving as the recursive walk itself*.
- Recursive Hadamard walk program X declared by the recursive equation:

$$X \Leftarrow T_L[p] \oplus_{H[d]} (T_R[p]; X)$$

► The walk first runs the "coin-tossing" Hadamard operator *H*[*d*] and then a quantum case statement:

- ► The walk first runs the "coin-tossing" Hadamard operator *H*[*d*] and then a quantum case statement:
 - ▶ if the "direction coin" *d* is in state |L⟩ then the walker moves one position left, followed by a procedure behaving as the recursive walk itself;

- ► The walk first runs the "coin-tossing" Hadamard operator *H*[*d*] and then a quantum case statement:
 - ▶ if the "direction coin" *d* is in state |L⟩ then the walker moves one position left, followed by a procedure behaving as the recursive walk itself;
 - if *d* is in state |*R*⟩ then it moves one position right, also followed by a procedure behaving as the recursive walk itself.

- ► The walk first runs the "coin-tossing" Hadamard operator *H*[*d*] and then a quantum case statement:
 - if the "direction coin" *d* is in state |L> then the walker moves one position left, followed by a procedure behaving as the recursive walk itself;
 - if *d* is in state |*R*⟩ then it moves one position right, also followed by a procedure behaving as the recursive walk itself.
- The walk Program *X* (or program *Y*) declared by the recursive equation:

 $X \leftarrow (T_L[p]; X) \oplus_{H[d]} (T_R[p]; X)$

- ► The walk first runs the "coin-tossing" Hadamard operator *H*[*d*] and then a quantum case statement:
 - ▶ if the "direction coin" *d* is in state |L⟩ then the walker moves one position left, followed by a procedure behaving as the recursive walk itself;
 - if *d* is in state |*R*⟩ then it moves one position right, also followed by a procedure behaving as the recursive walk itself.
- The walk Program X (or program Y) declared by the recursive equation:

$$X \Leftarrow (T_L[p]; X) \oplus_{H[d]} (T_R[p]; X)$$

A variant of the bidirectional recursive Hadamard walk is declared by the following system of recursive equations:

$$\begin{cases} X \Leftarrow T_L[p] \oplus_{H[d]} (T_R[p]; Y), \\ Y \Leftarrow (T_L[p]; X) \oplus_{H[d]} T_R[p] \end{cases}$$

A More Interesting Recursive Quantum Walk

Let *n* ≥ 2. Another variant of unidirectional recursive quantum walk is defined as the program declared by the following recursive equation:

$$X \leftarrow ((T_L[p];X) \oplus_{H[d]} (T_R[p];X)); (T_L[p] \oplus_{H[d]} T_R[p])^n$$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ のへぐ

A More Interesting Recursive Quantum Walk

$$X \leftarrow ((T_L[p];X) \oplus_{H[d]} (T_R[p];X)); (T_L[p] \oplus_{H[d]} T_R[p])^n$$

- コン・4回シュービン・4回シューレー

How to solve these quantum recursive equations?

Syntactic Approximation

• A recursive program *X* declared by equation

 $X \Leftarrow F(X)$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ のへぐ

Syntactic Approximation

A recursive program X declared by equation

 $X \Leftarrow F(X)$

Syntactic approximations:

$$\begin{cases} X^{(0)} = \mathbf{Abort}, \\ X^{(n+1)} = F[X^{(n)}/X] \text{ for } n \ge 0. \end{cases}$$

- コン・4回シュービン・4回シューレー

Program $X^{(n)}$ is the *n*th syntactic approximation of *X*.

Syntactic Approximation

• A recursive program *X* declared by equation

 $X \Leftarrow F(X)$

Syntactic approximations:

$$\begin{cases} X^{(0)} = \text{Abort,} \\ X^{(n+1)} = F[X^{(n)}/X] \text{ for } n \ge 0. \end{cases}$$

Program $X^{(n)}$ is the *n*th syntactic approximation of *X*.

Semantics [[X]] of X is the limit

$$[\![X]\!] = \lim_{n \to \infty} [\![X^{(n)}]\!]$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

$$\begin{split} X^{(0)} &= \text{abort,} \\ X^{(1)} &= T_L[p] \oplus_{H[d]} (T_R[p]; \text{abort}), \\ X^{(2)} &= T_L[p] \oplus_{H[d]} (T_R[p]; T_L[p] \oplus_{H[d_1]} (T_R[p]; \text{abort})), \\ X^{(3)} &= T_L[p] \oplus_{H[d]} (T_R[p]; T_L[p] \oplus_{H[d_1]} (T_R[p]; T_L[p] \oplus_{H[d_2]} (T_R[p]; \text{abort}))), \\ \dots \dots \dots \dots \end{split}$$

$$\begin{split} X^{(0)} &= \text{abort,} \\ X^{(1)} &= T_L[p] \oplus_{H[d]} (T_R[p]; \text{abort}), \\ X^{(2)} &= T_L[p] \oplus_{H[d]} (T_R[p]; T_L[p] \oplus_{H[d_1]} (T_R[p]; \text{abort})), \\ X^{(3)} &= T_L[p] \oplus_{H[d]} (T_R[p]; T_L[p] \oplus_{H[d_1]} (T_R[p]; T_L[p] \oplus_{H[d_2]} (T_R[p]; \text{abort}))), \\ \dots \dots \dots \end{split}$$

Observation

Continuously introduce new "coin" to avoid variable conflict.

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ のへぐ

► Variables *d*, *d*₁, *d*₂, ... denote identical particles.

$$\begin{split} X^{(0)} &= \text{abort,} \\ X^{(1)} &= T_L[p] \oplus_{H[d]} (T_R[p]; \text{abort}), \\ X^{(2)} &= T_L[p] \oplus_{H[d]} (T_R[p]; T_L[p] \oplus_{H[d_1]} (T_R[p]; \text{abort})), \\ X^{(3)} &= T_L[p] \oplus_{H[d]} (T_R[p]; T_L[p] \oplus_{H[d_1]} (T_R[p]; T_L[p] \oplus_{H[d_2]} (T_R[p]; \text{abort}))), \\ \dots \dots \dots \end{split}$$

Observation

- Continuously introduce new "coin" to avoid variable conflict.
- ► Variables *d*, *d*₁, *d*₂, ... denote identical particles.
- The number of the "coin" particles that are needed in running the recursive walk is unknown beforehand.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

$$\begin{split} X^{(0)} &= \text{abort,} \\ X^{(1)} &= T_L[p] \oplus_{H[d]} (T_R[p]; \text{abort}), \\ X^{(2)} &= T_L[p] \oplus_{H[d]} (T_R[p]; T_L[p] \oplus_{H[d_1]} (T_R[p]; \text{abort})), \\ X^{(3)} &= T_L[p] \oplus_{H[d]} (T_R[p]; T_L[p] \oplus_{H[d_1]} (T_R[p]; T_L[p] \oplus_{H[d_2]} (T_R[p]; \text{abort}))), \\ \dots \dots \dots \end{split}$$

Observation

- Continuously introduce new "coin" to avoid variable conflict.
- ▶ Variables *d*, *d*₁, *d*₂, ... denote identical particles.
- The number of the "coin" particles that are needed in running the recursive walk is unknown beforehand.
- We need to deal with *quantum systems where the number of particles of the same type may vary.*

Add a particle in the individual state $|\psi\rangle$ to the system of *n* particles without modifying their respective states.

Creation and Annihilation of Particles

- The transitions between states of different particle numbers.
- Creation operator $a^*(\psi)$ in $\mathcal{F}_v(\mathcal{H})$:

$$a^*(\psi)|\psi_1,...,\psi_n\rangle_v = \sqrt{n+1}|\psi,\psi_1,...,\psi_n\rangle_v$$

Add a particle in the individual state $|\psi\rangle$ to the system of *n* particles without modifying their respective states.

• Annihilation operator $a(\psi)$ — the Hermitian conjugate of $a^*(\psi)$:

$$\begin{split} a(\psi)|\mathbf{0}\rangle &= 0,\\ a(\psi)|\psi_1,...,\psi_n\rangle_v &= \frac{1}{\sqrt{n}}\sum_{i=1}^n (v)^{i-1} \langle \psi|\psi_i\rangle |\psi_1,...,\psi_{i-1},\psi_{i+1},...,\psi_n\rangle_v \end{split}$$

Decrease the number of particles by one unit, while preserving the symmetry of the state.
Outline

1. Introduction

2. Quantum Case Statement and Quantum Choice

3. Motivating Example: Recursive Quantum Walks

4. Second Quantisation

5. Semantics of Quantum Recursion

7. Conclusion

▲□▶▲圖▶▲≣▶▲≣▶ ■ のQ@

Second quantisation provides us with the necessary tool for defining the semantics of quantum recursion!

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ のへぐ

Second quantisation provides us with the necessary tool for defining the semantics of quantum recursion!

Example - (Unidirectional) Recursive Hadamard Walk Semantics of the recursive Hadamard walk:

$$\llbracket X \rrbracket = \left[\sum_{i=0}^{\infty} \left(\bigotimes_{j=0}^{i-1} |R\rangle_{d_j} \langle R| \otimes |L\rangle_{d_i} \langle L| \right) \otimes T_L T_R^i \right] (\mathbf{H} \otimes I)$$

An operator in

$$\mathcal{F}_v(\mathcal{H}_d)\otimes\mathcal{H}_p\to\mathcal{F}(\mathcal{H}_d)\otimes\mathcal{H}_p.$$

- ロト・ 日本・ モー・ モー・ うらく

► The sign v is + or -, depending on using bosons or fermions to implement the "direction coins" d, d₁, d₂,

Principal System Semantics

• Each state $|\Psi\rangle$ in Fock space $\mathcal{F}_v(\mathcal{H}_d)$ induces mapping:

 $\llbracket X, \Psi \rrbracket_p : \text{pure states} \to \text{partial density operators in } \mathcal{H}_p$ $\llbracket X, \Psi \rrbracket_p(|\psi\rangle) = tr_{\mathcal{F}(\mathcal{H}_d)}(|\Phi\rangle\langle\Phi|)$

- コン・4回シュービン・4回シューレー

where $|\Phi\rangle = \llbracket X \rrbracket (|\Psi\rangle \otimes |\psi\rangle)$

Principal System Semantics

• Each state $|\Psi\rangle$ in Fock space $\mathcal{F}_v(\mathcal{H}_d)$ induces mapping:

 $\llbracket X, \Psi \rrbracket_p : \text{pure states} \to \text{partial density operators in } \mathcal{H}_p$ $\llbracket X, \Psi \rrbracket_p(|\psi\rangle) = tr_{\mathcal{F}(\mathcal{H}_d)}(|\Phi\rangle\langle\Phi|)$

where $|\Phi\rangle = \llbracket X \rrbracket (|\Psi\rangle \otimes |\psi\rangle)$

 Mapping [[X, Ψ]]_p is called the principal system semantics of X with "coin" initialisation |Ψ⟩.

Bidirectional Recursive Quantum Walk

$$\begin{cases} X \Leftarrow T_L[p] \oplus_{H[d]} (T_R[p]; Y), \\ Y \Leftarrow (T_L[p]; X) \oplus_{H[d]} T_R[p] \end{cases}$$

Coherent state of bosons in the symmetric Fock space *F*₊(*H*) over *H*:

$$|\psi\rangle_{\rm coh} = \exp\left(-\frac{1}{2}\langle\psi|\psi\rangle\right)\sum_{n=0}^{\infty}\frac{[a^*(\psi)]^n}{n!}|\mathbf{0}\rangle$$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ● ●

Bidirectional Recursive Quantum Walk

$$\begin{cases} X \Leftarrow T_L[p] \oplus_{H[d]} (T_R[p]; Y), \\ Y \Leftarrow (T_L[p]; X) \oplus_{H[d]} T_R[p] \end{cases}$$

Coherent state of bosons in the symmetric Fock space *F*₊(*H*) over *H*:

$$|\psi\rangle_{\rm coh} = \exp\left(-\frac{1}{2}\langle\psi|\psi\rangle\right)\sum_{n=0}^{\infty}\frac{[a^*(\psi)]^n}{n!}|\mathbf{0}\rangle$$

The walk starts from position 0 and the coins are initialised in the coherent states of bosons corresponding to |L>:

$$\begin{split} \llbracket X, L_{\operatorname{coh}} \rrbracket_{p}(|0\rangle) &= \frac{1}{\sqrt{e}} \left(\sum_{k=0}^{\infty} \frac{1}{2^{2k+1}} |-1\rangle \langle -1| + \sum_{k=0}^{\infty} \frac{1}{2^{2k+2}} |2\rangle \langle 2| \right) \\ &= \frac{1}{\sqrt{e}} \left(\frac{2}{3} |-1\rangle \langle -1| + \frac{1}{3} |2\rangle \langle 2| \right). \end{split}$$

where *W* a unitary operator in $\mathcal{H}_c \otimes \mathcal{H}_q$ — the interaction between the "coin" *c* and the principal system *q*.

Quantum while-loop

Program X declared by the recursive equation

$$X \Leftarrow W[c,q]; \operatorname{\mathbf{qif}}[c] \ket{0} o \operatorname{\mathbf{skip}}$$

 $\Box \ket{1} o U[q]; X$
fiq

where *W* a unitary operator in $\mathcal{H}_c \otimes \mathcal{H}_q$ — the interaction between the "coin" *c* and the principal system *q*.

Semantics of X:

$$\llbracket X \rrbracket = \sum_{k=1}^{\infty} \prod_{j=0}^{k-1} W[c_j, q] \left(\bigotimes_{j=0}^{k-2} |1\rangle_{c_j} \langle 1| \otimes |0\rangle_{c_{k-1}} \langle 0| \otimes U^{k-1}[q] \right)$$

from the space $\mathcal{F}_v(\mathcal{H}_2) \otimes \mathcal{H}_q$ into $\mathcal{F}(\mathcal{H}_2) \otimes \mathcal{H}_q$.
