The CQM approach:

Why quantum algorithms?

- ▶ Quantum algorithms as a change of perspective, i.e. *view physical structure as information processing*
- ▶ **Open question** (Theoretical): What does this mean?
 - ▶ What is the physical role of computational complexity?
 - ▶ What structures lead to speedups?
- ▶ **Open question** (Applied): What can we do with it?
 - ▶ How do we find useful quantum algorithms?

The CQM approach:

1. QM as an instance of general process theories in compact closed categories

Why quantum algorithms?

- ▶ Quantum algorithms as a change of perspective, i.e. *view physical structure as information processing*
- ▶ **Open question** (Theoretical): What does this mean?
 - ▶ What is the physical role of computational complexity?
 - ▶ What structures lead to speedups?
- ▶ **Open question** (Applied): What can we do with it?
 - ▶ How do we find useful quantum algorithms?

The CQM approach:

1. QM as an instance of general process theories in compact closed categories
2. Leverage the general setting and diagrammatic calculus to identify and exploit algorithmically useful structure

Overview

Quantum Algorithms: State of the Union

Blackbox algorithms in CQM: the old, the generalized, and the new

- Unitary Oracles

- Deutsch-Jozsa algorithm

- Hidden subgroup algorithms

- Group homomorphism identification algorithm

- Single-shot Grover's algorithm

Leveraging generality: other categories

Frontiers

- Quantum machine learning and connections to NLP

Quantum Algorithms: State of the Union

Many different techniques are used in practice:

- Quantum Fourier transform

- Hamilton simulation

- Phase estimation

- Quantum walks

- Topological quantum algorithms

- Adiabatic optimization

- Amplitude estimation

- etc.

Quantum Algorithms: State of the Union

- ▶ The quantum algorithm zoo (<http://math.nist.gov/quantum/zoo/>) lists some 42 different quantum algorithms
 - ▶ Only a handful show promise of exponential speedup
 - ▶ Three main categories: Algebraic/Number Theoretic, Approximation/Simulation, Oracular

Quantum Algorithms: State of the Union

- ▶ The quantum algorithm zoo (<http://math.nist.gov/quantum/zoo/>) lists some 42 different quantum algorithms
 - ▶ Only a handful show promise of exponential speedup
 - ▶ Three main categories: Algebraic/Number Theoretic, Approximation/Simulation, Oracular
- ▶ **Open question:** Is there a general theorem that tells us when we can hope for exponential speedups from quantum algorithms, and when we cannot?
[Aaronson and Ambainis 2014]

Unitary Oracles

- ▶ Oracles are blackboxes with unknown internal structure.

Unitary Oracles

- ▶ Oracles are blackboxes with unknown internal structure.
- ▶ Most known quantum algorithms are constructed using quantum oracles, the Deutsch-Josza algorithm, Shor's algorithm, Grover's algorithm...

Unitary Oracles

- ▶ Oracles are blackboxes with unknown internal structure.
- ▶ Most known quantum algorithms are constructed using quantum oracles, the Deutsch-Josza algorithm, Shor's algorithm, Grover's algorithm...
- ▶ Physical realizations of oracles place conditions on their "unknown" structure. (Unitarity in the quantum case)

Unitary Oracles

- ▶ Oracles are blackboxes with unknown internal structure.
- ▶ Most known quantum algorithms are constructed using quantum oracles, the Deutsch-Josza algorithm, Shor's algorithm, Grover's algorithm...
- ▶ Physical realizations of oracles place conditions on their "unknown" structure. (Unitarity in the quantum case)

Main questions:

Unitary Oracles

- ▶ Oracles are blackboxes with unknown internal structure.
- ▶ Most known quantum algorithms are constructed using quantum oracles, the Deutsch-Josza algorithm, Shor's algorithm, Grover's algorithm...
- ▶ Physical realizations of oracles place conditions on their “unknown” structure. (Unitarity in the quantum case)

Main questions:

- ▶ What is the abstract structure of these oracles?
- ▶ Can we take advantage of this abstract setting to gain new insights?

Unitary Oracles

The traditional Deutsch-Jozsa circuit is:

Unitary Oracles

Here is its abstract structure:

Unitary Oracles

This is the oracle's internal structure:

Unitary Oracles

This is the oracle's internal structure:

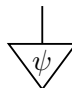

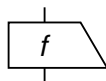

Theorem

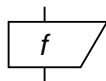

Oracles with this abstract structure are unitary in general.

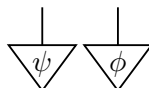

Categorical Quantum Information

View quantum information in the context of the dagger-compact category **FHilb**

 is a state $\psi : I \rightarrow \mathcal{H}$

 is a linear map $f : A \rightarrow B$.

 is the adjoint $f^\dagger : B \rightarrow A$.

 is the composite state $I \rightarrow \psi \otimes \phi$

Categorical Quantum Information

Definition: A special \dagger -Frobenius algebra $(A, \circlearrowleft, \circlearrowright)$ obeys:

Diagrammatic equations for Frobenius and multiplication properties:

- Associativity of multiplication: $(\circlearrowleft \circ \circlearrowleft) \circ \circlearrowleft = \circlearrowleft \circ (\circlearrowleft \circ \circlearrowleft)$
- Commutativity of multiplication: $\circlearrowleft \circ \circlearrowleft = \circlearrowleft \circ \circlearrowleft$

Diagrammatic equations for Frobenius and comultiplication properties:

- Associativity of comultiplication: $\circlearrowright \circ \circlearrowright = \circlearrowright \circ \circlearrowright$
- Commutativity of comultiplication: $\circlearrowright \circ \circlearrowright = \circlearrowright \circ \circlearrowright$

Diagrammatic equation for Frobenius property:

- Frobenius property: $\circlearrowleft \circ \circlearrowright = \circlearrowright \circ \circlearrowleft$

Categorical Quantum Information

Definition: A special \dagger -Frobenius algebra (A, μ, \circ) obeys:

Diagrammatic equations for Frobenius and multiplication properties:

- Associativity of multiplication: $(\mu \circ \mu) = \mu \circ (\mu)$
- Commutativity of multiplication: $(\mu \circ \mu) = (\mu \circ \mu)$

Diagrammatic equations for Frobenius and comultiplication properties:

- Associativity of comultiplication: $(\circ \circ \circ) = (\circ \circ \circ)$
- Comultiplication-Frobenius compatibility: $(\circ \circ \circ) = (\circ \circ \circ)$

Diagrammatic equation for Frobenius and comultiplication compatibility:

- Compatibility: $(\circ \circ \circ) = (\circ \circ \circ) = (\circ \circ \circ)$

This represents the abstract structure of an *observable* or generalized basis.

Complementary observables

Definition [Coecke & Duncan]: Two \dagger -Frobenius algebras on the same object are **complementary** when:

$$d(A) \quad \text{=} \quad \begin{array}{c} \text{---} \\ | \\ \circ \\ | \\ \text{---} \\ \text{---} \\ | \\ \bullet \\ | \\ \text{---} \end{array}$$

Complementary observables

Finite abelian groups give complementary observables in **FHilb**

- ▶ Copying

$$\curvearrowright :: |g\rangle \mapsto |g\rangle \otimes |g\rangle$$

$$\circlearrowleft :: |g\rangle \mapsto 1$$

- ▶ Group multiplication

$$\curvearrowleft :: |g_1\rangle \otimes |g_2\rangle \mapsto \frac{1}{\sqrt{D}} |g_1 \oplus g_2\rangle$$

$$\circlearrowright :: 1 \mapsto \sqrt{D} |0\rangle$$

Classical Maps

Definition:

A classical map $f : (A, \blacktriangleright, \bullet) \rightarrow (B, \blacktriangleright, \circ)$ obeys:

Classical Maps

Definition:

A classical map $f : (A, \blacktriangleright, \bullet) \rightarrow (B, \blacktriangleright, \circ)$ obeys:

These are self-conjugate comonoid homomorphisms.

Unitarity Theorem

- ▶ Three \dagger -Frobenius algebras, $(\bullet, \circ, \bullet)$

Unitarity Theorem

- ▶ Three \dagger -Frobenius algebras, $(\bullet, \circ, \bullet)$
- ▶ A pair are complementary (\bullet and \circ)

Unitarity Theorem

- ▶ Three \dagger -Frobenius algebras, $(\bullet, \circ, \bullet)$
- ▶ A pair are complementary $(\bullet$ and $\circ)$
- ▶ A classical map $f : (A, \uparrow, \downarrow) \rightarrow (B, \uparrow, \downarrow)$

Quantum algorithms: old, generalized and new

Deutsch-Jozsa

Single-shot Grover

Hidden subgroup

The Deutsch-Jozsa Algorithm

- ▶ Blackbox function $f : \{0, 1\}^N \rightarrow \{0, 1\}$ is *balanced* when it takes each possible value the same number of times

The Deutsch-Jozsa Algorithm

- ▶ Blackbox function $f : \{0, 1\}^N \rightarrow \{0, 1\}$ is *balanced* when it takes each possible value the same number of times

Definition (The Deutsch-Jozsa problem)

Given a blackbox function f promised to be either *constant* or *balanced*, identify which.

The Deutsch-Jozsa Algorithm

- ▶ Blackbox function $f : \{0, 1\}^N \rightarrow \{0, 1\}$ is *balanced* when it takes each possible value the same number of times

Definition (The Deutsch-Jozsa problem)

Given a blackbox function f promised to be either *constant* or *balanced*, identify which.

- ▶ Classically we require at most $2^{N-1} + 1$ queries of f

The Deutsch-Jozsa Algorithm

- ▶ Blackbox function $f : \{0, 1\}^N \rightarrow \{0, 1\}$ is *balanced* when it takes each possible value the same number of times

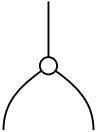

Definition (The Deutsch-Jozsa problem)

Given a blackbox function f promised to be either *constant* or *balanced*, identify which.

- ▶ Classically we require at most $2^{N-1} + 1$ queries of f
- ▶ The quantum algorithm only requires a *single* query.

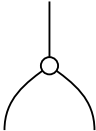

Group Algebras

Recall the group multiplying observable:

$$G \times G \xrightarrow{m} G$$

Group Algebras

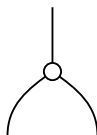

Recall the group multiplying observable:

$$G \otimes G \xrightarrow{m} G$$

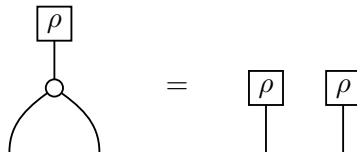

A one-dimensional representation $G \xrightarrow{\rho} \mathbb{C}$ is:

Group Algebras

Recall the group multiplying observable:

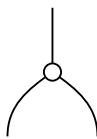

$$G \otimes G \xrightarrow{m} G$$

A one-dimensional representation $G \xrightarrow{\rho} \mathbb{C}$ is:

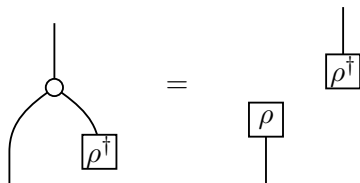

$$\begin{array}{c} \square \rho \\ | \\ \circ \\ \swarrow \quad \searrow \end{array} = \begin{array}{c} \square \rho \\ | \end{array} \quad \begin{array}{c} \square \rho \\ | \end{array}$$

Group Algebras

Recall the group multiplying observable:

$$G \otimes G \xrightarrow{m} G$$

A one-dimensional representation $G \xrightarrow{\rho} \mathbb{C}$ is:

$$\text{Diagram with } \rho^\dagger \text{ box} = \text{Diagram with } \rho \text{ box and } \rho^\dagger \text{ box}$$

The adjoint $\mathbb{C} \xrightarrow{\rho} G$ is also copied on the lower legs.

CQM Deutsch-Jozsa

$$\sigma(0) = 1 \text{ and } \sigma(1) = -1$$

CQM Deutsch-Jozsa

► Slide up σ^\dagger

CQM Deutsch-Jozsa

► Slide up σ^\dagger

► Pull σ^\dagger through the whitedot

CQM Deutsch-Jozsa

- ▶ Slide up σ^\dagger
- ▶ Pull σ^\dagger through the whitedot
- ▶ Neglect the right-side system

CQM Deutsch-Jozsa

- ▶ Slide up σ^\dagger
- ▶ Pull σ^\dagger through the whitedot
- ▶ Neglect the right-side system
- ▶ Spider law for the black dot

CQM Deutsch-Jozsa

Gives the amplitude for the input state $\frac{1}{\sqrt{|S|}} \sum_s |s\rangle$ to be in the σ state at measurement.

CQM Deutsch-Jozsa

Gives the amplitude for the input state $\frac{1}{\sqrt{|S|}} \sum_s |s\rangle$ to be in the σ state at measurement.

What if f is balanced?

so the system is never measured in σ .

CQM Deutsch-Jozsa

Gives the amplitude for the input state $\frac{1}{\sqrt{|S|}} \sum_s |s\rangle$ to be in the σ state at measurement.

What if f is balanced?

so the system is never measured in σ .

What if f is constant?

Then

So the system is always measured in σ .

Notes CQM Deutsch-Josza

- ▶ Verify: Abstractly verify the algorithm

Notes CQM Deutsch-Josza

Hidden subgroup

GroupHom ID

The group homomorphism identification problem

- ▶ **Definition. (Group homomorphism identification problem)**
Given finite groups G and A where A is abelian, and a blackbox function $f : G \rightarrow A$ promised to be a group homomorphism, identify f .

The group homomorphism identification algorithm

Case: Let A be a cyclic group \mathbb{Z}_n .

The group homomorphism identification algorithm

The group homomorphism identification algorithm

The group homomorphism identification algorithm

The group homomorphism identification algorithm

The group homomorphism identification algorithm

- ▶ $\rho \circ f$ is an irreducible representation of G .

The group homomorphism identification algorithm

- ▶ $\rho \circ f$ is an irreducible representation of G .
- ▶ Choose ρ to be a faithful representation of A .

The group homomorphism identification algorithm

- ▶ $\rho \circ f$ is an irreducible representation of G .
- ▶ Choose ρ to be a faithful representation of A .
- ▶ Then measuring $\rho \circ f$ identifies f (up to isomorphism)

The group homomorphism identification algorithm

- ▶ $\rho \circ f$ is an irreducible representation of G .
- ▶ Choose ρ to be a faithful representation of A .
- ▶ Then measuring $\rho \circ f$ identifies f (up to isomorphism)
- ▶ One-dimensional representations are isomorphic only if they are equal.

The group homomorphism identification algorithm

Homomorphism $f : G \rightarrow A$

- ▶ We generalize with proof by induction via the Structure Theorem. $A = \mathbb{Z}_{p_1} \oplus \dots \oplus \mathbb{Z}_{p_k}$
- ▶ Can identify the group homomorphism in k oracle queries.
- ▶ The naive classical solution requires a number of queries equal to the number of factors of G rather than A .

See [Zeng & Vicary 2014]

Grover's Algorithm

Background:

- ▶ Grover's quantum algorithm finds a single marked element of a finite set in $O(\sqrt{N})$ trials, vs classical $O(N)$.

Grover's Algorithm

Background:

- ▶ Grover's quantum algorithm finds a single marked element of a finite set in $O(\sqrt{N})$ trials, vs classical $O(N)$.
- ▶ If exactly $\frac{1}{4}$ of the elements are marked, it can find a marked element in a *single trial*.

Grover's Algorithm

Background:

- ▶ Grover's quantum algorithm finds a single marked element of a finite set in $O(\sqrt{N})$ trials, vs classical $O(N)$.
- ▶ If exactly $\frac{1}{4}$ of the elements are marked, it can find a marked element in a *single trial*.

In [Vicary 2013]:

- ▶ Verification of the single-shot Grover's algorithm.

Grover's Algorithm

Background:

- ▶ Grover's quantum algorithm finds a single marked element of a finite set in $O(\sqrt{N})$ trials, vs classical $O(N)$.
- ▶ If exactly $\frac{1}{4}$ of the elements are marked, it can find a marked element in a *single trial*.

In [Vicary 2013]:

- ▶ Verification of the single-shot Grover's algorithm.
- ▶ The CQM perspective highlights the structural role of the group \mathbb{Z}_2 .

Grover's Algorithm

Background:

- ▶ Grover's quantum algorithm finds a single marked element of a finite set in $O(\sqrt{N})$ trials, vs classical $O(N)$.
- ▶ If exactly $\frac{1}{4}$ of the elements are marked, it can find a marked element in a *single trial*.

In [Vicary 2013]:

- ▶ Verification of the single-shot Grover's algorithm.
- ▶ The CQM perspective highlights the structural role of the group \mathbb{Z}_2 .
- ▶ Changing the finite group gives 'multicoloured' quantum search algorithms which achieve tasks that ordinary Grover search cannot.

Examples

The generalized single-shot Grover algorithm finds colours whose 'weighted phase' *doesn't* take twice the average value.

Examples

The generalized single-shot Grover algorithm finds colours whose 'weighted phase' *doesn't* take twice the average value.

Suppose $f : S \rightarrow \mathbb{Z}_2 \simeq \{R, G\}$, $\sigma = (1, -1)$.
Essentially, red and green balls at ± 1 .

For one colour to take twice the average value we require a 3:1 ratio.

Rarer colour returned in a single query.
Standard result from Grover theory.

Examples

The generalized single-shot Grover algorithm finds colours whose 'weighted phase' *doesn't* take twice the average value.

Suppose $f : S \rightarrow \mathbb{Z}_2 \simeq \{R, G\}$, $\sigma = (1, -1)$.
Essentially, red and green balls at ± 1 .

For one colour to take twice the average value we require a 3:1 ratio.

Rarer colour returned in a single query.
Standard result from Grover theory.

Now suppose $f : S \rightarrow \mathbb{Z}_3 \simeq \{R, G, B\}$, $\sigma = (1, e^{2\pi i/3}, e^{4\pi i/3})$.
Red, green, blue balls at $e^{2n\pi i/3}$.

For one colour to take twice the average value we require a 4:1:1 ratio.

A rarer colour returned in a single query.
Cannot be done with ordinary Grover algorithm.

Concluding Grover's

- ▶ We can verify and generalize Grover's algorithm with the CQM framework.
[Vicary 2013]

Concluding Grover's

- ▶ We can verify and generalize Grover's algorithm with the CQM framework.
[Vicary 2013]
- ▶ Since Grover's forms the basis for other quantum subroutines, e.g. amplitude amplification, amplitude estimation, and quantum minimization algorithms, etc. This is an important building block.

Leveraging generality: other categories

- ▶ Relate Unitary Oracles to the resistor structure in signal-flow calculus [Zeng & Vicary 2014]
- ▶ Define these algorithms in Rel

- ▶ We should think about computational speedup as a property of a physical theory in much the same way that we think about contextuality and non-locality.

The closest vector problem

The closest vector problem

Definition

Given vector s and a set of M vectors $U = \{\vec{v}_0, \vec{v}_1, \dots, \vec{v}_{M-1}\}$ the *closest vector problem* asks one to determine which v_i has the smallest inner product distance with s . We will assume that all vectors are N -dimensional.

The closest vector problem

Definition

Given vector s and a set of M vectors $U = \{\vec{v}_0, \vec{v}_1, \dots, \vec{v}_{M-1}\}$ the *closest vector problem* asks one to determine which v_i has the smallest inner product distance with s . We will assume that all vectors are N -dimensional.

- ▶ Appears in clustering, text classification, phrase/word similarity, sentiment analysis, etc.

The closest vector problem

Definition

Given vector s and a set of M vectors $U = \{\vec{v}_0, \vec{v}_1, \dots, \vec{v}_{M-1}\}$ the *closest vector problem* asks one to determine which v_i has the smallest inner product distance with s . We will assume that all vectors are N -dimensional.

- ▶ Appears in clustering, text classification, phrase/word similarity, sentiment analysis, etc.
- ▶ Classical algorithms for this problem have complexity $\mathcal{O}(MN)$.

A quantum algorithm for the closest vector problem

Definition (SWAP Test)

A quantum algorithm for the closest vector problem

Definition (SWAP Test)

Hadamard Transform:

$$H :: |0\rangle \rightarrow \frac{1}{\sqrt{2}}(|0\rangle + |1\rangle)$$
$$|1\rangle \rightarrow \frac{1}{\sqrt{2}}(|0\rangle - |1\rangle)$$

A quantum algorithm for the closest vector problem

Definition (SWAP Test)

Resulting state: $\frac{1}{2}|0\rangle(|\phi\rangle|\psi\rangle + |\psi\rangle|\phi\rangle) + \frac{1}{2}|1\rangle(|\phi\rangle|\psi\rangle - |\psi\rangle|\phi\rangle)$,

A quantum algorithm for the closest vector problem

Definition (SWAP Test)

Resulting state: $\frac{1}{2}|0\rangle(|\phi\rangle|\psi\rangle + |\psi\rangle|\phi\rangle) + \frac{1}{2}|1\rangle(|\phi\rangle|\psi\rangle - |\psi\rangle|\phi\rangle)$,
Probability of measuring the left system to be zero is

$$1/2 - |\langle\phi|\psi\rangle|^2/2.$$

A quantum algorithm for the closest vector problem

Definition (SWAP Test)

Resulting state: $\frac{1}{2}|0\rangle(|\phi\rangle|\psi\rangle + |\psi\rangle|\phi\rangle) + \frac{1}{2}|1\rangle(|\phi\rangle|\psi\rangle - |\psi\rangle|\phi\rangle)$,
Probability of measuring the left system to be zero is

$$1/2 - |\langle\phi|\psi\rangle|^2/2.$$

Takeaway: In a single step we can encode the inner product of two vectors.

A quantum algorithm for the closest vector problem

qCVECTOR has the following steps:

1. Add ancillary qubits $|i\rangle$ (for indexing) and $|\psi_i\rangle$ (for the SWAP test) and apply the **SWAP test** (without measurement) for each pair (s, v_i) .

A quantum algorithm for the closest vector problem

qCVECT has the following steps:

1. Add ancillary qubits $|i\rangle$ (for indexing) and $|\psi_i\rangle$ (for the SWAP test) and apply the **SWAP test** (without measurement) for each pair (s, v_i) .
2. Perform coherent **amplitude estimation** to determine the amplitude of the zero state for the ancillary qubits $|\psi_0\rangle, |\psi_1\rangle, \dots$. This stores the distances estimates in a qubit string without measurement. [Wiebe et. al. 2014]

A quantum algorithm for the closest vector problem

qCVECTOR has the following steps:

1. Add ancillary qubits $|i\rangle$ (for indexing) and $|\psi_i\rangle$ (for the SWAP test) and apply the **SWAP test** (without measurement) for each pair (s, v_i) .
2. Perform coherent **amplitude estimation** to determine the amplitude of the zero state for the ancillary qubits $|\psi_0\rangle, |\psi_1\rangle, \dots$. This stores the distances estimates in a qubit string without measurement. [Wiebe et. al. 2014]
3. Use the Dürr-Hoyer **minimization** algorithm to return the i which minimizes $(1 - |\langle v_i | s \rangle|^2)$.

A quantum algorithm for the closest vector problem

qCVECT has the following steps:

1. Add ancillary qubits $|i\rangle$ (for indexing) and $|\psi_i\rangle$ (for the SWAP test) and apply the **SWAP test** (without measurement) for each pair (s, v_i) .
2. Perform coherent **amplitude estimation** to determine the amplitude of the zero state for the ancillary qubits $|\psi_0\rangle, |\psi_1\rangle, \dots$. This stores the distances estimates in a qubit string without measurement. [Wiebe et. al. 2014]
3. Use the Dürr-Hoyer **minimization** algorithm to return the i which minimizes $(1 - |\langle v_i | s \rangle|^2)$.

The runtime is $\mathcal{O}(Me^{-1/2})$ and a slightly more complicated version runs in almost $\mathcal{O}(\sqrt{M}e^{-1/2})$

Complexity Comparisons

- ▶ TIME: Classification tasks can be performed in runtimes that are independent of the dimension of the meaning space.

Complexity Comparisons

- ▶ TIME: Classification tasks can be performed in runtimes that are independent of the dimension of the meaning space.
- ▶ SPACE: Exponential reduction in required space. An N -dimensional classical vector requires $\log_2 N$ qubits.

Complexity Comparisons

- ▶ TIME: Classification tasks can be performed in runtimes that are independent of the dimension of the meaning space.
- ▶ SPACE: Exponential reduction in required space. An N -dimensional classical vector requires $\log_2 N$ qubits.
 - ▶ DisCo becomes more attractive as large order tensors are feasibly implemented

Complexity Comparisons

- ▶ TIME: Classification tasks can be performed in runtimes that are independent of the dimension of the meaning space.
- ▶ SPACE: Exponential reduction in required space. An N -dimensional classical vector requires $\log_2 N$ qubits.
 - ▶ DisCo becomes more attractive as large order tensors are feasibly implemented
 - ▶ Secrecy advantages. Classification task requires less queries than are necessary to reconstruct the classifying clusters.

Thanks!
