

# Advanced Topics in Machine Learning

Alejo Nevado-Holgado

Lecture 15 (NLP 7) - Question answering, conference  
resolution and CNNs

V 0.3 (26 Feb 2020 - final version)

# Course structure

- **Introduction:** What is NLP. Why it is hard. Why NNs work well ← **Lecture 9** (NLP 1)
- **Word representation:** How to represent the meaning of individual words
  - Old technology: One-hot representations, synsets ← **Lecture 9** (NLP 1)
  - Embeddings: First trick that boosted the performance of NNs in NLP ← **Lecture 9** (NLP 1)
    - Word2vec: Single layer NN. CBOW and skip-gram ← **Lecture 10** (NLP 2)
    - Co-occurrence matrices: Basic counts and SVD improvement ← **Lecture 10** (NLP 2)
    - Glove: Combining word2vec and co-occurrence matrices idea ← **Lecture 10** (NLP 2)
    - Evaluating performance of embeddings ← **Lecture 10** (NLP 2)
- **Named Entity Recognition (NER):** How to find words of specific meaning within text
  - Multilayer NNs: Margin loss. Forward- and back-propagation ← **Lecture 11** (NLP 3)
  - Better loss functions: margin loss, regularisation ← **Lecture 11** (NLP 3)
  - Better initializations: uniform, xavier ← **Lecture 11** (NLP 3)
  - Better optimizers: Adagrad, RMSprop, Adam... ← **Lecture 11** (NLP 3)

# Course structure

- **Language modelling:** How to represent the meaning of full pieces of text
  - Old technology: N-grams ← **Lecture 12** (NLP 4)
  - Recursive NNs language models (RNNs) ← **Lecture 12** (NLP 4)
  - Evaluating performance of language models ← **Lecture 12** (NLP 4)
  - Vanishing gradients: Problem. Gradient clipping ← **Lecture 13** (NLP 5)
  - Improved RNNs: LSTM, GRU, Bidirectional... ← **Lecture 13** (NLP 5)
- **Machine translation:** How to translate text
  - Old technology: Georgetown–IBM experiment and ALPAC report ← **Lecture 14** (NLP 6)
  - Seq2seq: Greedy decoding, encoder-decoder, beam search ← **Lecture 14** (NLP 6)
  - Attention: Simple attention, transformers, reformers ← **Lecture 14** (NLP 6)
  - Evaluating performance: BLEU ← **Lecture 14** (NLP 6)

# Course structure

## ➤ **Question Answering: X**

- Task definition, datasets, cloze-style tasks, Attentive Reader ← **Lecture 15** (NLP 7)

## ➤ **Conference Resolution: X**

- Task definition, pairs method, clustering method, language models ← **Lecture 15** (NLP 7)

## ➤ **Convolutional Neural Networks: X**

- CNNs in vision, CNNs in language, example ← **Lecture 15** (NLP 7)

## ➤ **Transformers: X**

- Architecture: encoder, self-attention, encoding position, decoder ← **Lecture 16** (NLP 8)
- Existing systems. Ranking ← **Lecture 16** (NLP 8)

# Questions answering: The problem

## Question

---

When were the first pyramids built?

Jean-Claude Juncker

How old is Keir Starmer?

What is the current price for AAPL?

What's the weather like in London?

Whom did Juncker meet with?

When did you get to this lecture?

Why do we yawn?

# Questions answering: The problem

Question	Answer
When were the first pyramids built?	2630 BC
Jean-Claude Juncker	<i>Jean-Claude Juncker is a Luxembourgish politician. Since 2014, Juncker has been President of the European Commission.</i>
How old is Keir Starmer?	54 years
What is the current price for AAPL?	136.50 USD
What's the weather like in London?	7 degrees Celsius. Clear with some clouds.
Whom did Juncker meet with?	<i>The European Commission president was speaking after meeting with Irish Taoiseach Enda Kenny in Brussels.</i>
When did you get to this lecture?	Five minutes after it started.
Why do we yawn?	<i>When we're bored or tired we don't breathe as deeply as we normally do. This causes a drop in our blood-oxygen levels and yawning helps us counter-balance that.</i>

# Questions answering: Why deal with it?

- **Because QA is awesome**
  - That's it
- **Because QA is AI-complete**
  - Theoretically, if we solve QA, we can solve everything
- **Because QA has many immediate applications**
  - Fine grain search, dialogue, information extraction, summarisation...
- **Some very good results already**
  - IBM Watson and Jeopardy, Siri, Google Search...
- **Many other improvements and applications left to do**
  - Both challenging problems and low hanging fruit

# Questions answering: Deployed systems

Who was Australia's third prime minister?

[All](#) [News](#) [Images](#) [Videos](#) [Maps](#) [More](#) [Settings](#) [Tools](#)

About 6,030,000 results (0.69 seconds)

## John Christian Watson

**John Christian Watson** (born **John Christian Tanck**; 9 April 1867 – 18 November 1941), commonly known as **Chris Watson**, was an Australian politician who served as the third Prime Minister of Australia.

# Questions answering: Deployed systems

## ➤ Before 2015

- MCTest (Richardson et al 2013): **2.6K** questions
- ProcessBank (Berant et al 2014): **500** questions

## ➤ After 2015

-  CNN/Daily Mail,  Image-GRU<sup>[arXiv:1703.02620v1]</sup>
-  Children Book Test, GPT2
-  WikiQA, TANDA<sup>[arXiv:1911.04118v2]</sup>
-  TriviaQA, MemoReader<sup>[10.18653/v1/D18-1237]</sup>
-  SQuAD 2.0, aIBERT<sup>[arXiv:2001.09694v1]</sup>
-  SQuAD 1.1, XLNet<sup>[arXiv:1906.08237v2]</sup>
-  News QA, BERT<sup>[arXiv:1907.10529v3]</sup>
-  MS MARCO, Masque<sup>[arXiv:1901.02262v2]</sup>
- More than **100K** questions!

# Questions answering: Deployed systems

## ➤ Before 2015

- Lexical matching
- Logistic regression

## ➤ After 2015

- Attentive reader
- Memory networks
- ReasoNet
- Match-LSTM
- Attention sum reader
- Attention-over-attention reader
- Iterative attention reader
- Dynamic coattention networks
- Bi-directional Attention Flow Network
- Multi-perspective Context Matching

# Cloze-style task: CNN/Daily Mail

**Close task:** A test where words or pieces of text have been removed, in order for the test-taker to infer them. In ML we replace nouns by anonymous **@tokens** to prevent the NN from using world knowledge, and force it to use logical inference based solely on what is written in the text of the task, not what is written in other datasets used for pre-training.

P

( @entity4 ) if you feel a ripple in the force today , it may be the news that the official @entity6 is getting its first gay character . according to the sci-fi website @entity9 , the upcoming novel " @entity11 " will feature a capable but flawed @entity13 official named @entity14 who " also happens to be a lesbian . " the character is the first gay figure in the official @entity6 -- the movies , television shows , comics and books approved by @entity6 franchise owner @entity22 -- according to @entity24 , editor of " @entity6 "

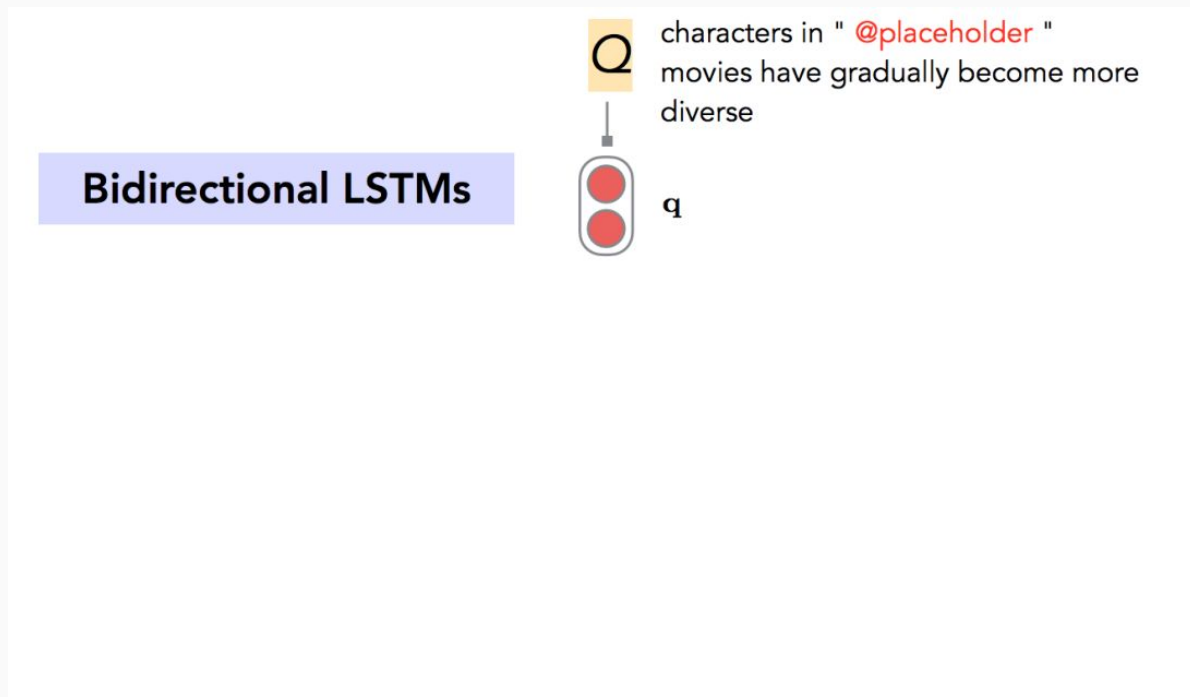

Q

characters in " @placeholder " movies have gradually become more diverse

A

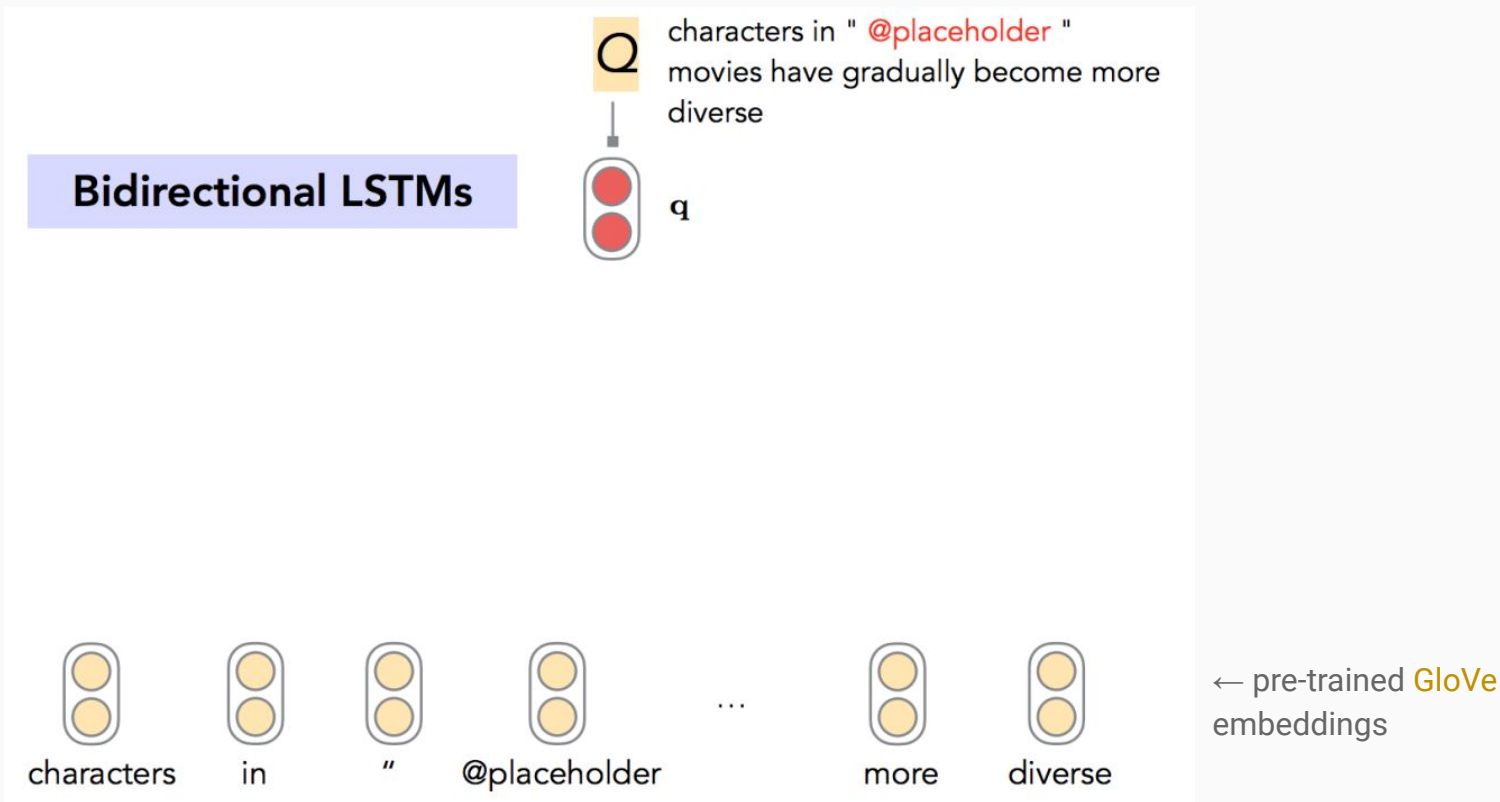

@entity6

# CNN/Daily Mail: Stanford Attentive Reader

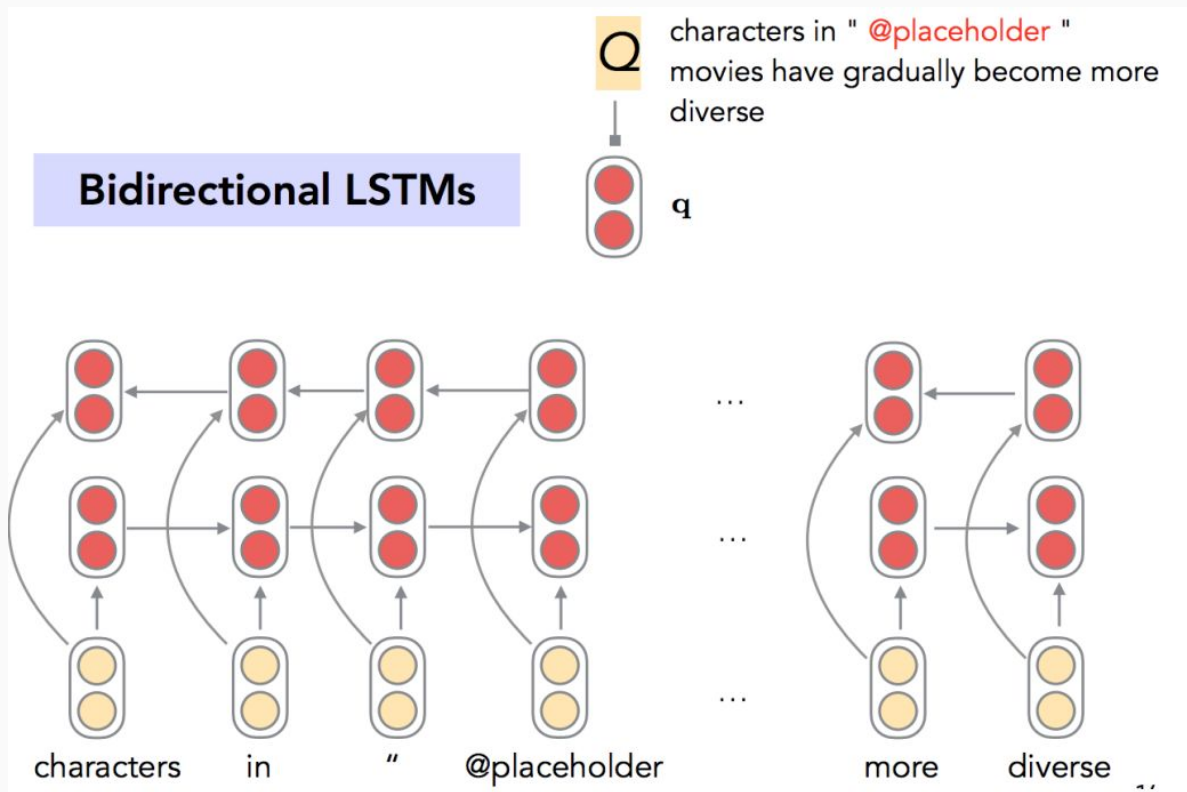

A Thorough Examination of the CNN/Daily Mail Reading Comprehension Task  
D Chen, J Bolton & CD Manning, Stanford University [arXiv:1606.02858v2]

# CNN/Daily Mail: Stanford Attentive Reader

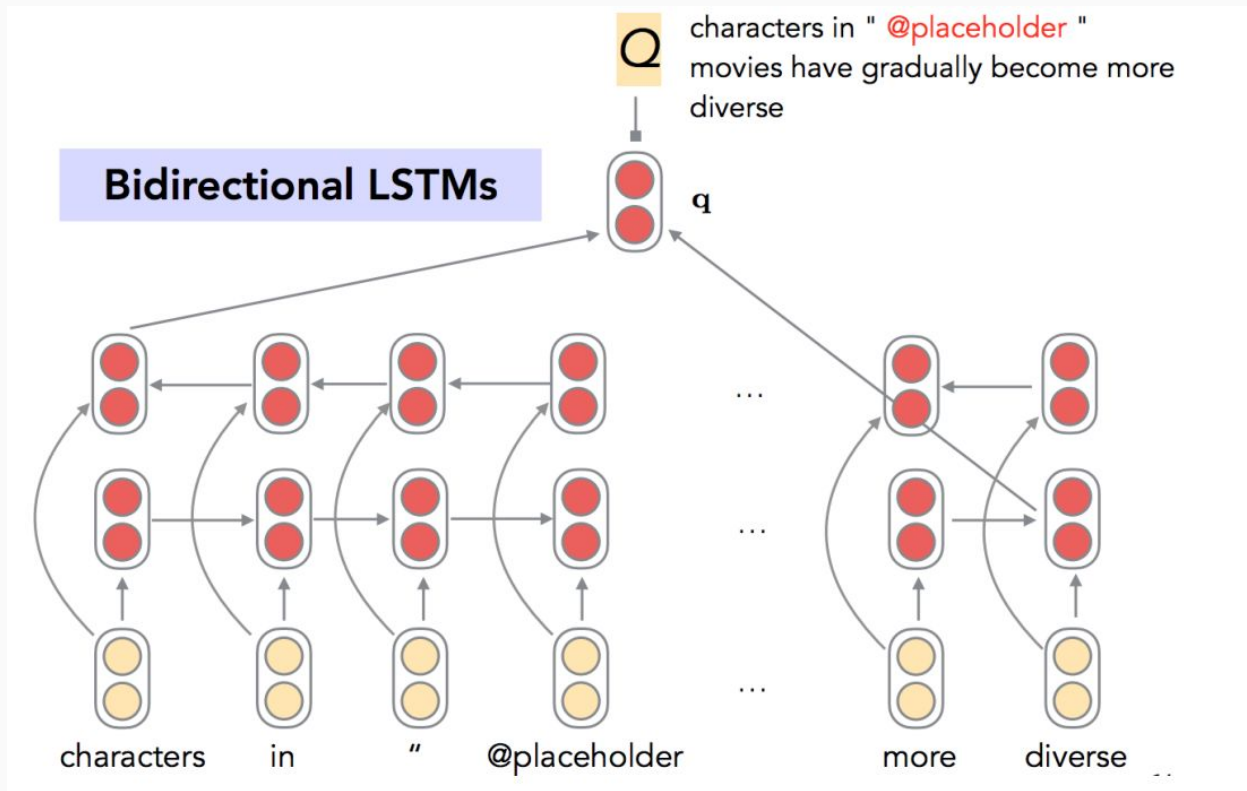

# CNN/Daily Mail: Stanford Attentive Reader

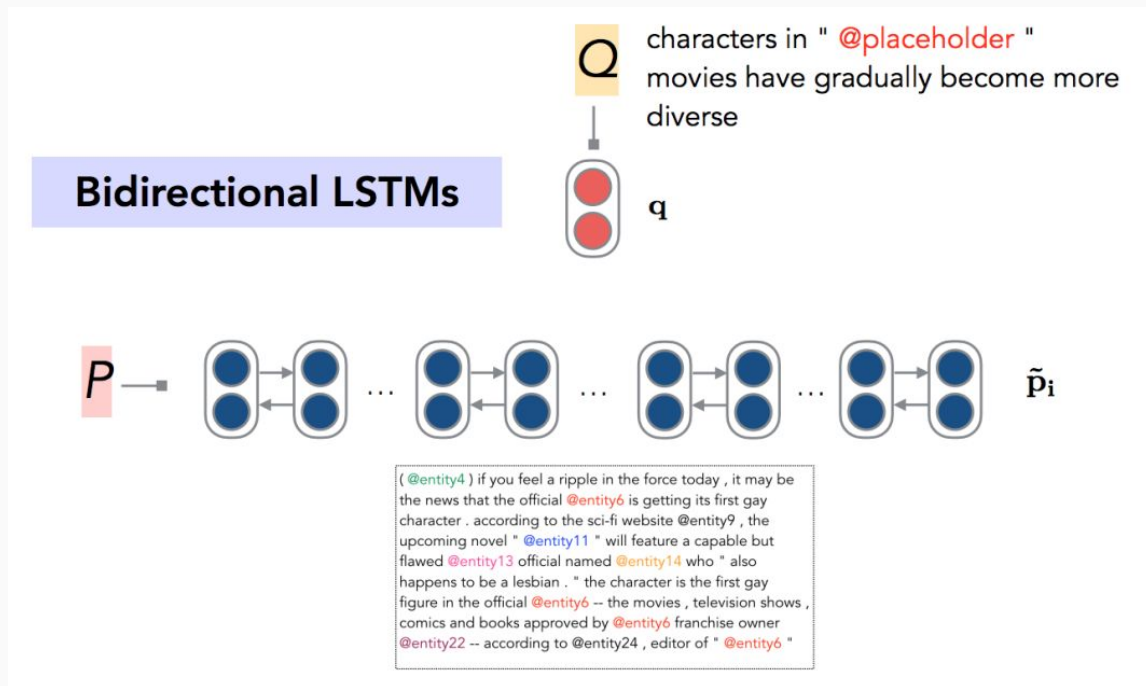

# CNN/Daily Mail: Stanford Attentive Reader

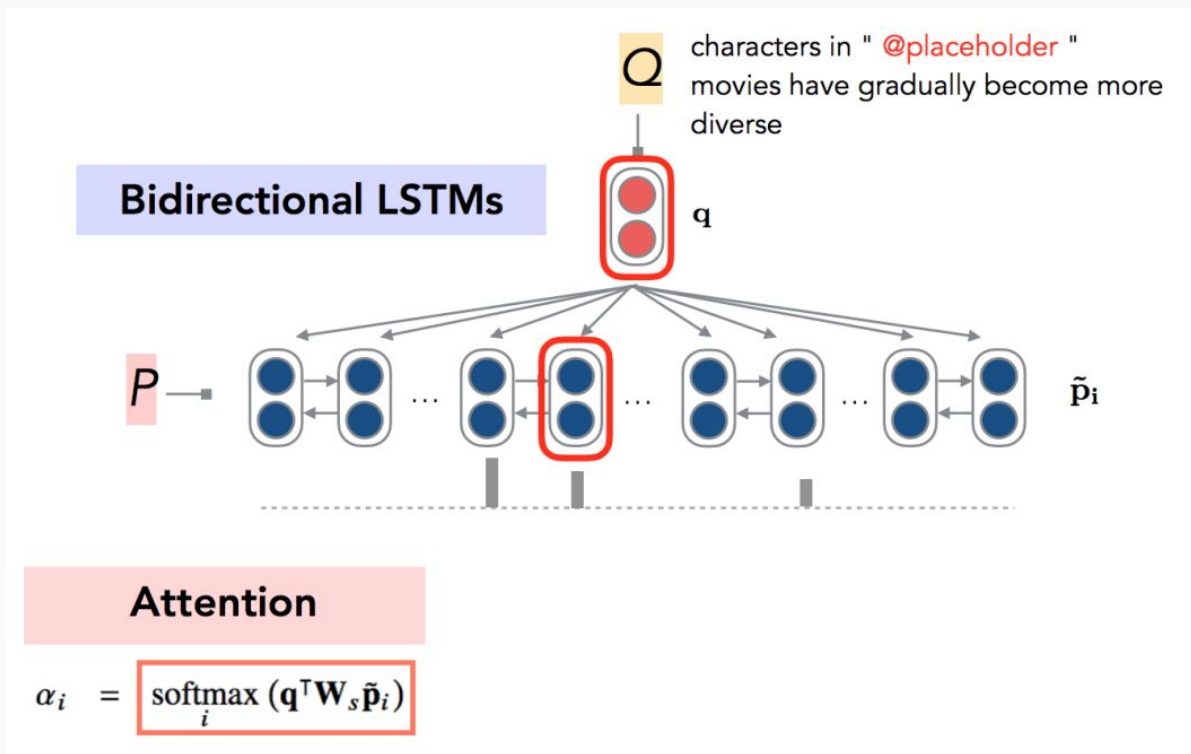

← Take only last LSTM **states** and concatenate them

# CNN/Daily Mail: Stanford Attentive Reader

← This is also a 1-layer bidirectional LSTM (or GRU) on top of GloVe embeddings

# CNN/Daily Mail: Stanford Attentive Reader

← Multiplicative attention!

# Translation: Attention

- There are several typical versions of attention:
- **Dot-product attention:** values and query are dot-multiplied to obtain attention score

$$\mathbf{e}^{(t)} = [ \mathbf{s}^{(t)} \cdot \mathbf{h}^{(1)}, \mathbf{s}^{(t)} \cdot \mathbf{h}^{(2)}, \dots, \mathbf{s}^{(t)} \cdot \mathbf{h}^{(T)} ] \in \mathbb{R}^T$$

- **Multiplicative attention:** the query is linearly transformed with  $\mathbf{W}$

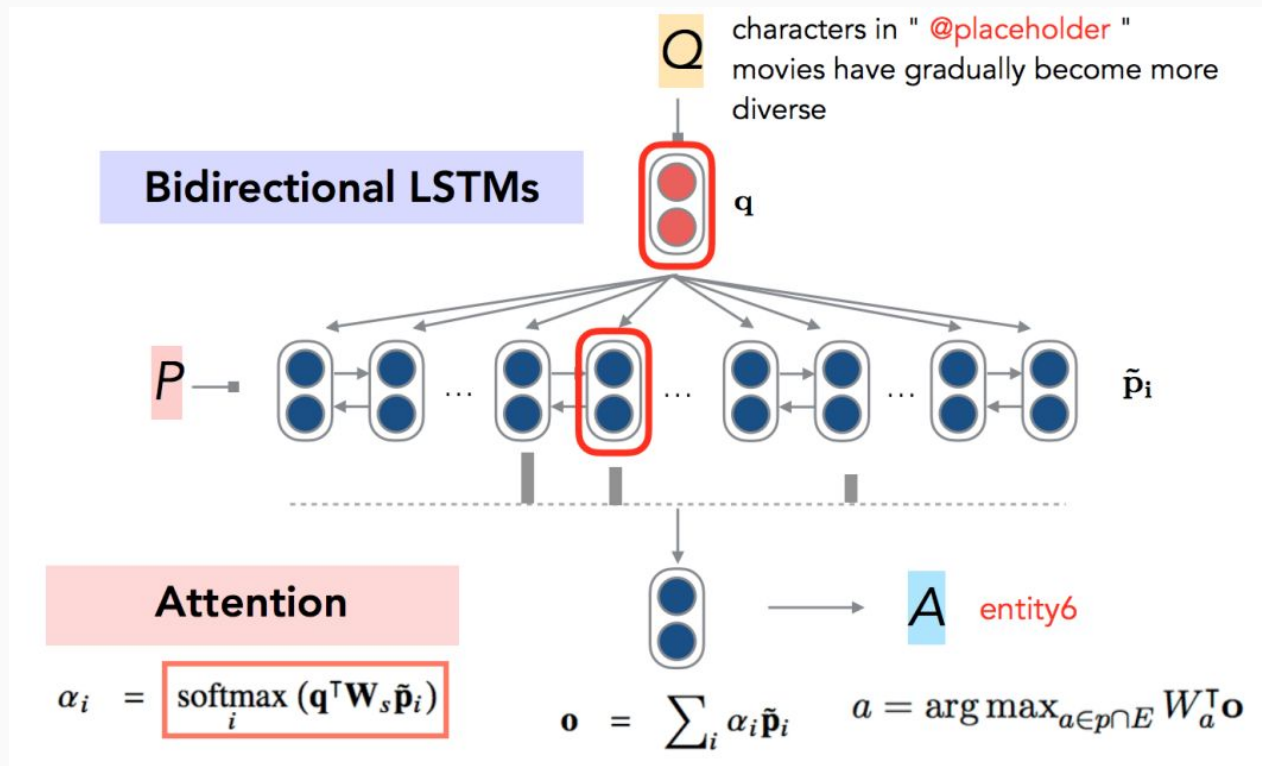

$$\mathbf{e}^{(t)} = [ \mathbf{s}^{(t)} \mathbf{W} \mathbf{h}^{(1)}, \mathbf{s}^{(t)} \mathbf{W} \mathbf{h}^{(2)}, \dots, \mathbf{s}^{(t)} \mathbf{W} \mathbf{h}^{(T)} ] \in \mathbb{R}^T$$

- **Additive attention:** values and query are both linearly transformed by  $\mathbf{W}_h$  and  $\mathbf{W}_s$ , respectively. The result, is averaged with average-weights  $\mathbf{v}$

$$\mathbf{e}^{(t)} = [ \mathbf{v} \cdot \tanh( \mathbf{W}_s \mathbf{s}^{(t)} + \mathbf{W}_h \mathbf{h}^{(1)} ), \mathbf{v} \cdot \tanh( \mathbf{W}_s \mathbf{s}^{(t)} + \mathbf{W}_h \mathbf{h}^{(2)} ), \dots ] \in \mathbb{R}^T$$

Deep learning for NLP best practices", Ruder, 2017. <http://ruder.io/deep-learning-nlp-best-practices/index.html#attention>  
Massive exploration of neural machine translation architectures", Britz et al., 2017. <https://arxiv.org/pdf/1703.03906.pdf>

# CNN/Daily Mail: Stanford Attentive Reader

←  $p \cap E$  = all abstract  
@entities present in the  
paragraph  $\{p_i\}$

# Conference resolution: The problem

**The problem:** Similar to NER. In NER we wanted to identify mentions that refer to any entity of a given class. In conference resolution, in addition to this, we want to identify which mentions refer to exactly the same particular entity.

Barack Obama nominated Hillary Rodham Clinton as his secretary of state on Monday. He chose her because she had foreign affairs experience as a former First Lady.

# Conference resolution: The problem

**The problem:** Similar to NER. In NER we wanted to identify **all mentions** that refer to any entity of a given class. In conference resolution, in addition to this, we want to identify which mentions refer to exactly the same particular entity.

Barack Obama nominated Hillary Rodham Clinton as his secretary of state on Monday. He chose her because she had foreign affairs experience as a former First Lady.

Barack Obama nominated Hillary Rodham Clinton as his secretary of state on Monday. He chose her because she had foreign affairs experience

# Conference resolution: The problem

**The problem:** Similar to NER. In NER we wanted to identify all mentions that refer to any entity of a given class. In conference resolution, in addition to this, we want to identify which mentions refer to exactly the **same particular entity**.

Barack Obama nominated **Hillary Rodham Clinton** as his **secretary of state** on Monday. He chose **her** because **she** had foreign affairs experience as a former **First Lady**.

# Conference resolution: The problem

**The problem:** Similar to NER. In NER we wanted to identify all mentions that refer to any entity of a given class. In conference resolution, in addition to this, we want to identify which mentions refer to exactly the **same particular entity**.

Barack Obama nominated **Hillary Rodham Clinton** as his  
**secretary of state** on Monday. He chose **her**  
had foreign affairs experience as a former

# Conference resolution: The problem

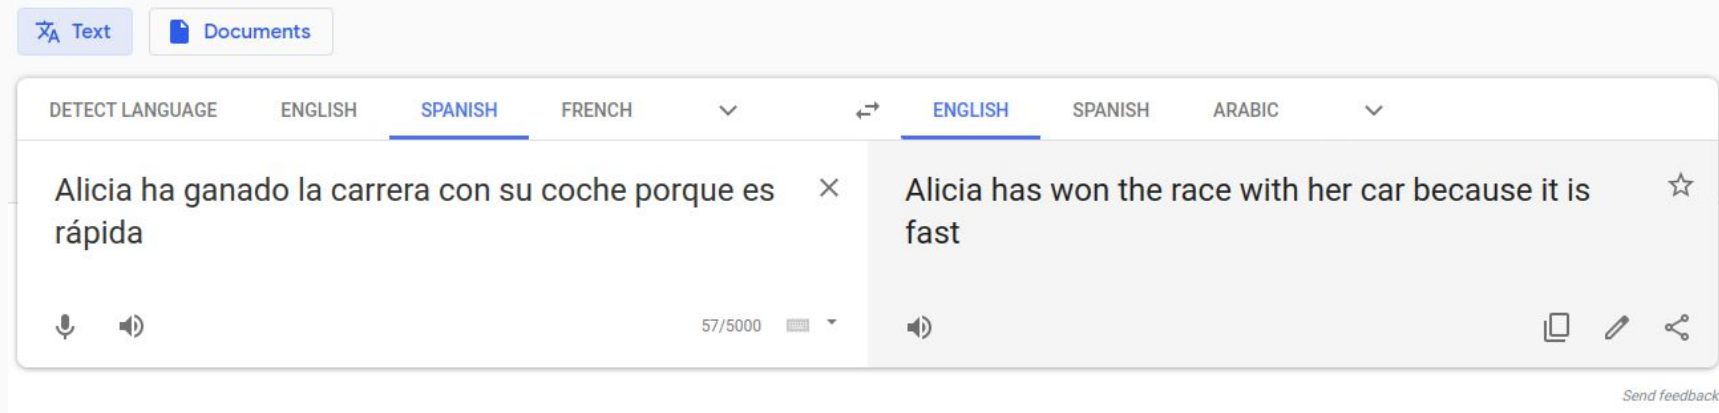

**The problem:** Similar to NER. In NER we wanted to identify all mentions that refer to any entity of a given class. In conference resolution, in addition to this, we want to identify which mentions refer to exactly the **same particular entity**.

Barack Obama nominated **Hillary Rodham Clinton** as his  
**secretary of state** on Monday. He chose **her**  
had foreign affairs experience as a former

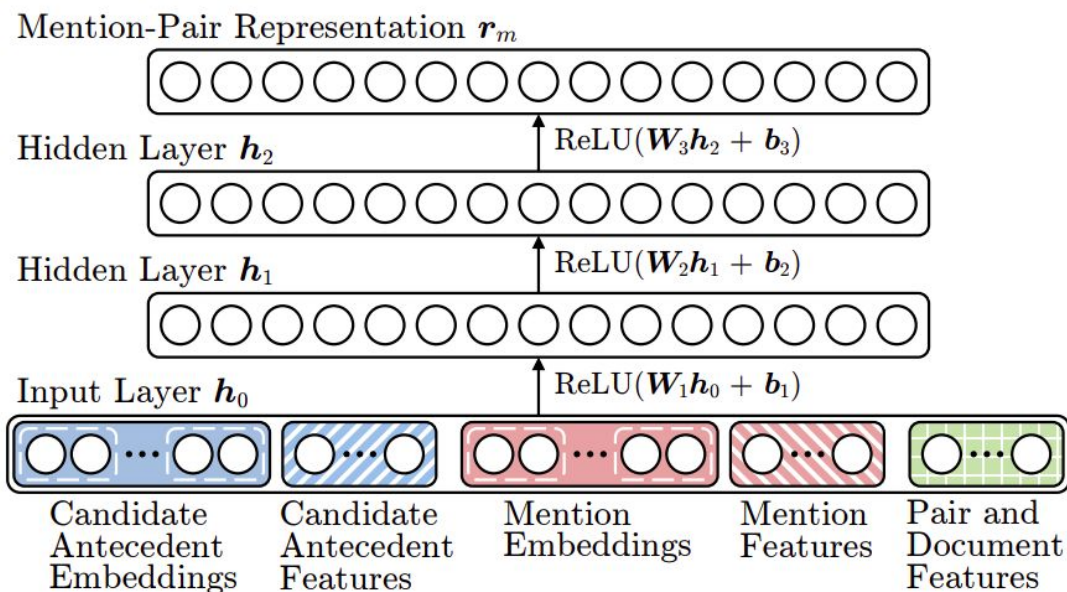

# Conference resolution: Why deal with it?

- **Because Conf Res is awesome**
  - But not as much as QA
- **Because Conf Res can help many downstream NLP tasks**
  - Information extraction, summarisation, question answering, full text understanding...
- **Many other improvements and applications left to do**
  - Both challenging problems and low hanging fruit

# Conference resolution: The solution

- **Solution 1:** Use a NN to model the probability that any pair of words in the text refer to the same entity

- **Mention features:**
- Distance
  - Part of Speech
  - Document class
  - Speaker information
  - ...

"Improving coreference resolution by learning entity-level distributed representations", Clark et al., 2016.  
<https://arxiv.org/pdf/1606.01323>  
58/10

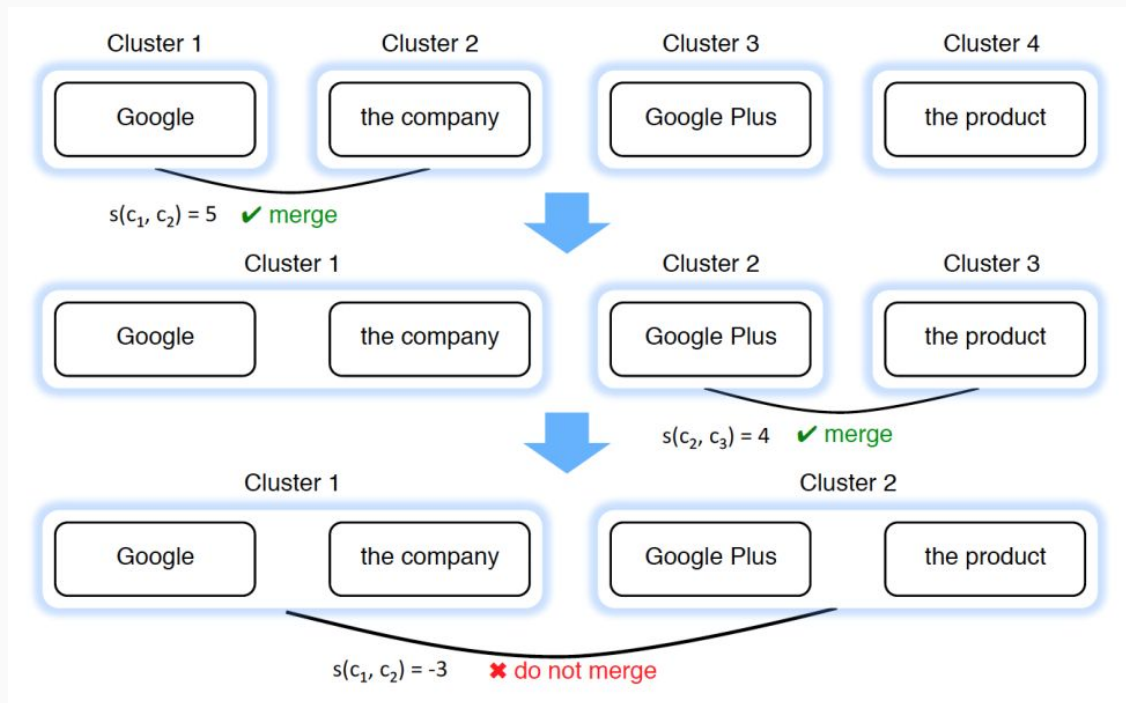

# Conference resolution: The solution

**Solution 2:** As in agglomerative clustering, gradually **merge** clusters of words that refer to the same entity, starting with one cluster per word

“Improving coreference resolution by learning entity-level distributed representations”, Clark et al., 2016.

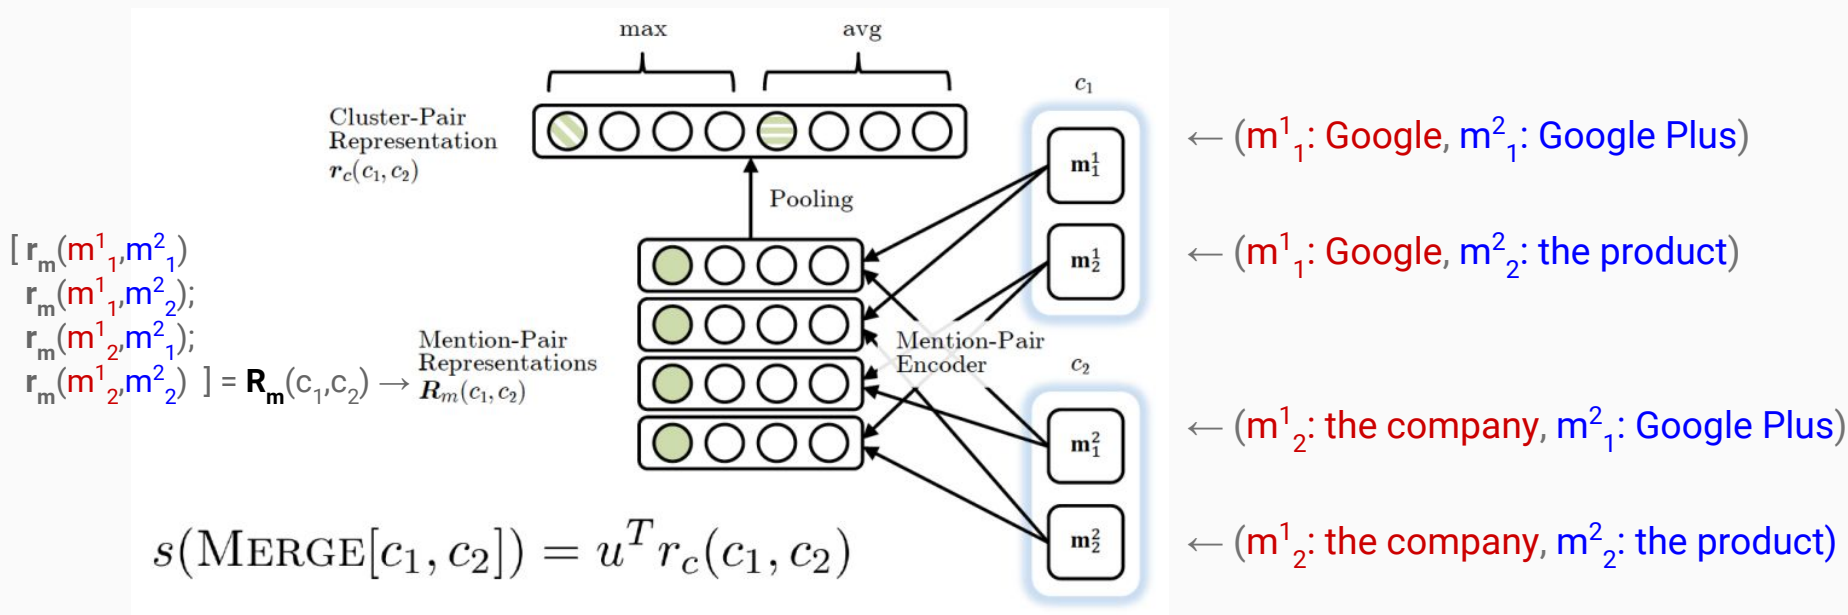

<https://arxiv.org/pdf/1606.01323>

*Google recently ... the company announced Google Plus ... the product features*

# Conference resolution: The solution

- **Solution 2:** As in agglomerative clustering, gradually **merge** clusters of words that refer to the same entity, starting with one cluster per word

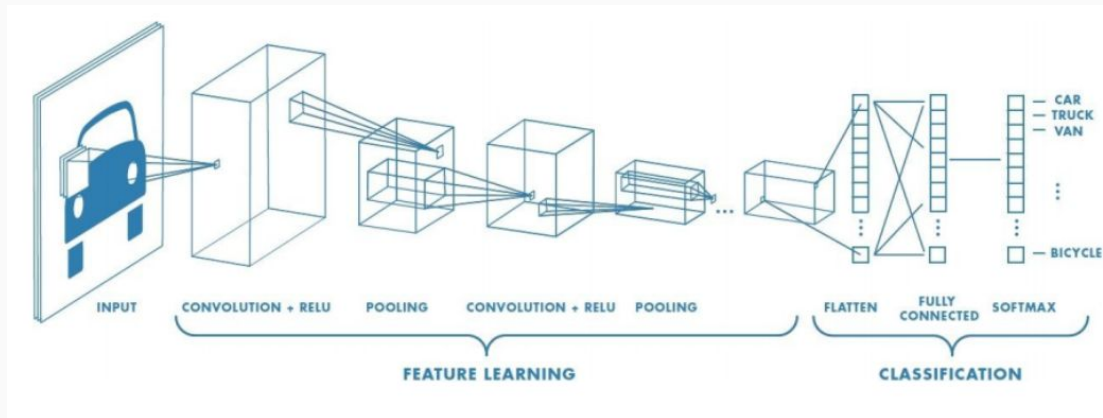

# Conference resolution: The solution

- **Solution 3:** Same as before... but with language models based on [Transformers](#). We will see in next lecture

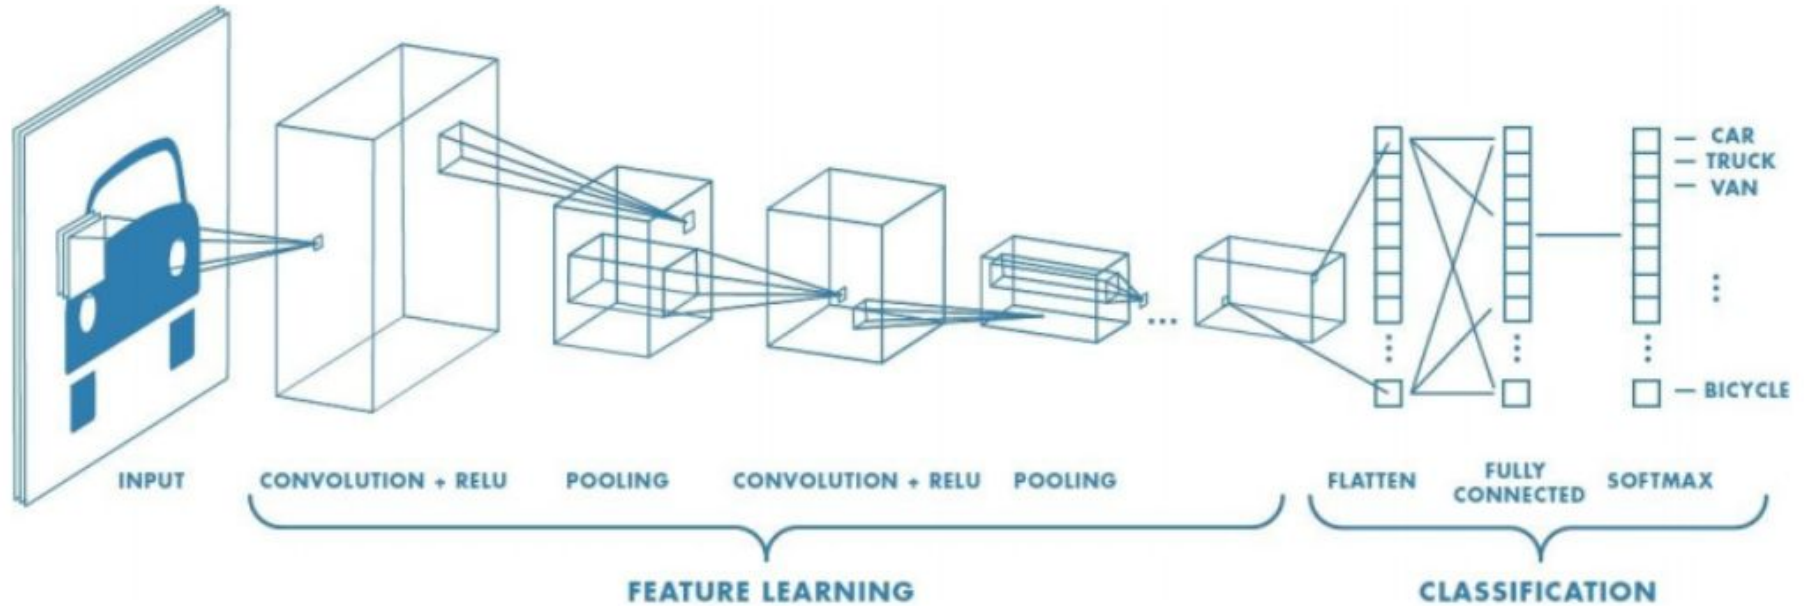

# Convolutional NNs: Why a new arch.?

- **The problem:** Traditional NN solutions to NLP problems mostly used some type of RNN (e.g. LSTM, GRU...). **Recurrences** are however very slow to train
- **The solution:** Convolutional NNs (CNNs) are the standard architecture in vision, where the **Convolutions** allow them to integrate information from all **pixels** in an **image**. **Convolutions** are much faster to train than **Recurrences**. We can apply **Convolutions** in language to integrate information from all **words** in a **document**.

# Convolutional NNs: An NLP example

Figure 1: Model architecture with two channels for an example sentence.

$n$ -words (possibly zero padded) and  
each word vector has  $k$ -dimensions

"Improving coreference resolution by learning entity-level distributed representations", Clark et al., 2016.

# Course structure

## ➤ **Question Answering: X**

- Task definition, datasets, cloze-style tasks, Attentive Reader ← **Lecture 15** (NLP 7)

## ➤ **Conference Resolution: X**

- Task definition, pairs method, clustering method, language models ← **Lecture 15** (NLP 7)

## ➤ **Convolutional Neural Networks: X**

- CNNs in vision, CNNs in language, example ← **Lecture 15** (NLP 7)

## ➤ **Transformers: X**

- Architecture: encoder, self-attention, encoding position, decoder ← **Lecture 16** (NLP 8)
- Existing systems. Ranking ← **Lecture 16** (NLP 8)
