

# Quantum Processes and Computation

Assignment 2, Friday, 20 Oct, 12:00

**Deadline:** Monday Week 4

**Goals:** After completing these exercises you should know how to reason with the transpose, adjoints, and the conjugate, and work with projections, unitaries and isometries. Material covered in book: Chapter 4.

**Note:** Many of these exercises also appear in *Picturing Quantum Processes*, but sometimes they have been slightly modified for the problem sheet. The corresponding exercise number from the book is shown in brackets.

**Exercise 1 (4.10 & 4.16):**

(a) Prove that in **relations**, the following relations on a set  $A$ :

$$\cup :: * \mapsto \{(a, a) \mid a \in A\} \quad \cap :: \forall a \in A : (a, a) \mapsto *$$

satisfy the *yanking equations* (eq. 4.11 in the book), and thus that **relations** has process-state duality.

(b) Show that process-state duality does not hold for **functions**.

**Exercise 2 (4.12):** Prove that

$$\text{[Diagram: a loop with a dot on the left side]} = \text{[Diagram: a vertical line]} \quad \text{or written differently:} \quad \text{[Diagram: a box with a dot on top and a dot on bottom, with two lines crossing]} = \text{[Diagram: a vertical line]}$$

follows from the following 4 equations:

$$\text{[Diagram: a wavy line]} = \text{[Diagram: a vertical line]} = \text{[Diagram: an inverted wavy line]} \quad \text{[Diagram: a figure-eight loop]} = \text{[Diagram: a cup shape]} \quad \text{[Diagram: a figure-eight loop with a dot]} = \text{[Diagram: a cap shape]}$$

**Hint:** Use the second notation (with the boxes) as it prevents you from accidentally cheating.

**Exercise 3 (4.14 in online version of PQP):** Show that the following are equivalent:

(i) a state and an effect satisfying:

$$\text{[Diagram: a box with a dot on top and a dot on bottom, with a line entering from the top and a line exiting from the bottom]} = \text{[Diagram: a vertical line]} \quad \text{[Diagram: a box with a dot on top and a dot on bottom, with two lines crossing]} = \text{[Diagram: a box with a dot on top and a dot on bottom, with two vertical lines entering from the top and two vertical lines exiting from the bottom]}$$

(ii) a state and an effect satisfying:

$$\text{[Diagram: a box with a dot on top and a dot on bottom, with a line entering from the bottom and a line exiting from the top]} = \text{[Diagram: a vertical line]} \quad \text{[Diagram: a box with a dot on top and a dot on bottom, with two lines crossing]} = \text{[Diagram: a box with a dot on top and a dot on bottom, with two vertical lines entering from the bottom and two vertical lines exiting from the top]}$$

So in particular, if either eqs. (i) or eqs. (ii) hold, then all equations hold.

**Exercise 4 (4.59):** An *inverse* for a process  $f : A \rightarrow B$  is a process  $f^{-1} : B \rightarrow A$  such that  $f^{-1} \circ f = \text{id}_A$  and  $f \circ f^{-1} = \text{id}_B$ . Show that for a process  $f$  the following are equivalent:

- $f$  is unitary.
- $f$  is an isometry and has an inverse.
- $f^\dagger$  is an isometry and has an inverse.

**Exercise 5 (4.37):** Show that the trace of a process is independent of the particular choice of cup and cap, i.e. that if  $\cup$  and  $\cap$  satisfy the yanking equations, but  $\cup'$  and  $\cap'$  also satisfy it that then:

In the lecture we saw the transpose. If a system has multiple inputs and outputs then there are two choices for the transpose. There is the *diagrammatic* transpose:

and the *algebraic* transpose:

(for more details see section 4.2.2 of the book)

**Exercise 6 (4.39):** The adjoint is an operation which acts like a vertical reflection. Show that the algebraic transpose is in this regard an adjoint, i.e. show diagrammatically that:

1. It is an involution:  $(f^T)^T = f$ ,
2. It preserves parallel composition:  $(f \otimes g)^T = f^T \otimes g^T$ ,
3. It preserves sequential composition:  $(f \circ g)^T = g^T \circ f^T$ ,

4. It preserves the identities:  $\text{id}^T = \text{id}$ ,
5. It sends cups to caps:  $\cup^T = \cap$ ,
6. It reverse the direction of swaps:  $\text{SWAP}_{A,B}^T = \text{SWAP}_{B,A}$

For a process  $f : A \rightarrow A$  we define its *separable projector* by

**Exercise 7 (4.73):** Given processes  $f_i : A \rightarrow A$  find the process  $g$  such that:

Write  $g$  as a sequential composition of the conjugates, transposes and adjoints of the  $f_i$ 's.

**Hint:** Doing exercise 4.73 from the book first might reveal whether you understand the concept.

**Exercise 8 (4.82):** A state  $\psi$  is *maximally non-separable* if it corresponds to a unitary  $U$  by process-state duality, up to a number:

Show (i) that if one applies a unitary  $V$  to one side of a maximally non-separable state:

that one again obtains a maximally non-separable state, and (ii) that this unitary can always be chosen such that the resulting state is the cup (up to a number).
