

Lecture 10

APPLICATION 3 Completeness of the ZX-calculus for Clifford diagrams.

Thm (COMPLETENESS) For Clifford ZX-diagrams D_1, D_2 , if $D_1 = D_2$ then $D_1 \xrightarrow{ZX} D_2$.

matrices are equal

can (efficiently!) transform D_1 to D_2 with the ZX-calc.

IDEA: Look at the AP form.

Def A graph-like ZX-diagram is in AP-form if all interior spiders:

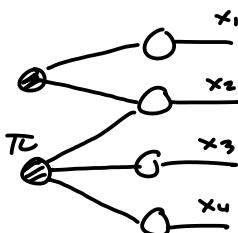

- have phase $\in 0, \pi$
- are only connected to boundary spiders.

$$\begin{array}{c}
 \text{Diagram with interior spiders labeled } b, \pi \\
 \text{and boundary labels } \vec{x}, \vec{a}, \vec{b} \\
 \text{with dashed lines for internal connections.}
 \end{array}
 =
 \begin{array}{c}
 \text{Diagram with interior spiders labeled } b, \pi \\
 \text{and boundary labels } \vec{x}, \vec{a}, \vec{b} \\
 \text{with solid lines for internal connections.}
 \end{array}
 =
 \sum_{\vec{x}, A\vec{x}=\vec{b}} e^{i\frac{\pi}{2} \cdot \phi} |\vec{x}\rangle$$

Affine Phases

$A = \{\vec{x} \mid A\vec{x} = \vec{b}\}$ is an affine subspace of \mathbb{F}_2^n .
 \vec{x} := a solution to a set of linear eqns, e.g.:

$$A = \left\{ \begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{pmatrix} \mid \begin{array}{l} x_1 \oplus x_2 = 0 \\ x_2 \oplus x_3 \oplus x_4 = 1 \end{array} \right\} \iff$$

≈

$$\sum_{\vec{x}, A\vec{x}=\vec{b}} |\vec{x}\rangle$$

ϕ is a phase polynomial

$$\begin{aligned}
 \text{Diagram} &= e^{i\pi \cdot (\frac{1}{2}x)} |x\rangle \\
 \text{Diagram} &= e^{i\pi \cdot (-\frac{1}{2}x)} |x\rangle \\
 \text{Diagram} &= (-1)^{x_1 x_2} \cdot \text{Diagram} = e^{i\pi(x_1 x_2)} \text{Diagram} \\
 \text{Diagram} &= e^{i\pi(x_1 x_2)} \cdot \text{Diagram} = e^{i\pi(x_1 x_2 + \frac{1}{2}x_1)} \text{Diagram}
 \end{aligned}$$

Phase polynomial

$$U|\vec{x}\rangle = e^{iTu \cdot \phi} |\vec{x}\rangle \text{ where } \phi = \frac{1}{2}x_1 - \frac{1}{2}x_3 + x_2 + x_3 x_4$$

$$U = \begin{array}{c} \text{Diagram} \\ \text{Diagram} \\ \text{Diagram} \\ \text{Diagram} \\ \text{Diagram} \end{array}$$

Def An AP-form is in reduced AP-form if it is \emptyset or A is in reduced echelon form and the polynomial ϕ only contains free variables from A .

$$\begin{array}{l}
 \text{Diagram} = \sum_{\vec{x}, A\vec{x}=\vec{b}} e^{i\pi \cdot \phi} |\vec{x}\rangle \\
 \text{Diagram} = \left(\begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{array} \right) \quad \begin{array}{l} \text{free var } x_3 \\ \text{echelon form} \end{array}
 \end{array}$$

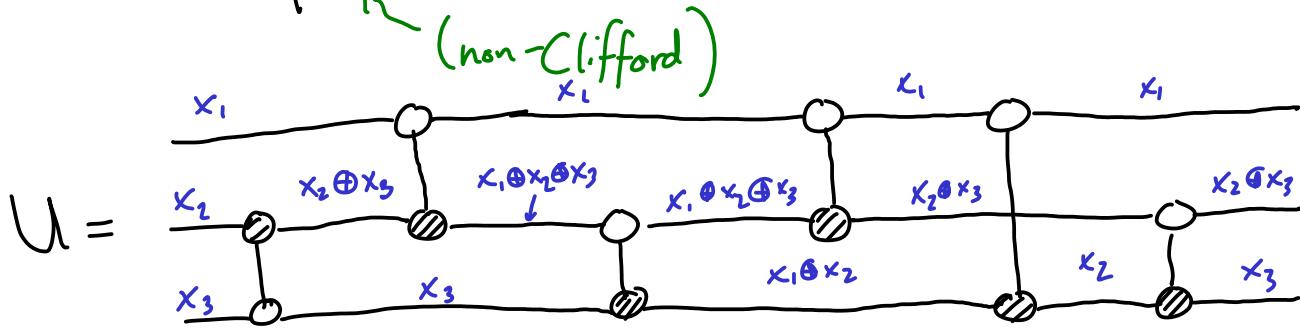

Prop Reduced AP-form is unique.

Pf (Linear algebra)

Prop For Clifford diag D , $D \stackrel{\text{zx}}{=} D'$ \hookrightarrow reduced AP-form.
Pf (zx can do Gaussian elimination!)

Cor Completeness!

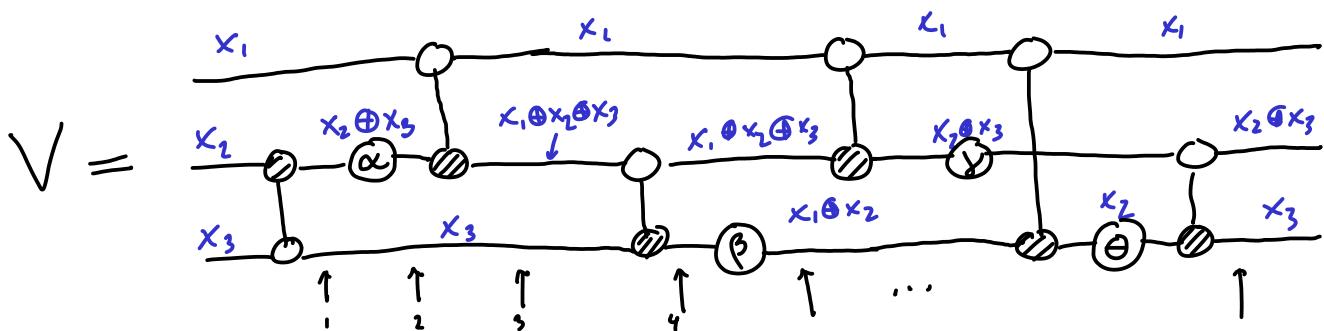

$CNOT + \text{phase}$ Circuits

$$U|x_1 x_2 x_3\rangle = |x_1, x_2 \oplus x_3, x_3\rangle$$

Q: What happens when we add phase gates?

$$Z[\alpha] :: |x\rangle \mapsto e^{i\alpha \cdot x}|x\rangle$$

$$(x_1 x_2 x_3) \mapsto |x_1, x_2 \oplus x_3, x_3\rangle$$

$$\mapsto e^{i\alpha \cdot (x_2 \oplus x_3)} |x_1, x_2 \oplus x_3, x_3\rangle$$

$$\mapsto e^{i\alpha \cdot (x_2 \oplus x_3)} |x_1, x_1 \oplus x_2 \oplus x_3, x_3\rangle$$

$$\mapsto e^{i\alpha \cdot (x_2 \oplus x_3)} |x_1, x_1 \oplus x_2 \oplus x_3, x_1 \oplus x_2\rangle$$

$$\mapsto e^{i[\alpha \cdot (x_2 \oplus x_3) + \beta \cdot (x_1 \oplus x_2)]} |x_1, x_1 \oplus x_2 \oplus x_3, x_1 \oplus x_2\rangle$$

$\mapsto \dots$

$$\mapsto e^{i[\alpha \cdot (x_2 \oplus x_3) + \beta \cdot (x_1 \oplus x_2) + \gamma \cdot (x_1 \oplus x_3) + \theta \cdot x_2]} |x_1, x_2 \oplus x_3, x_3\rangle$$

Prop Any CNOT+phase circuit describes a unitary of the form:

$$U: |\vec{x}\rangle \mapsto e^{i\phi(\vec{x})} |L\vec{x}\rangle.$$

↑ phase polynomial ← parity matrix.

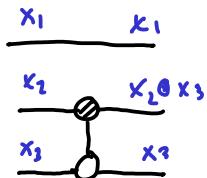

From the example above: $L = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix}$ and

$$\phi(x_1, x_2, x_3) = (\alpha + \gamma) \cdot (x_2 \otimes x_3) + \beta \cdot (x_1 \otimes x_2) + \theta \cdot x_2$$

↖ phase-folding

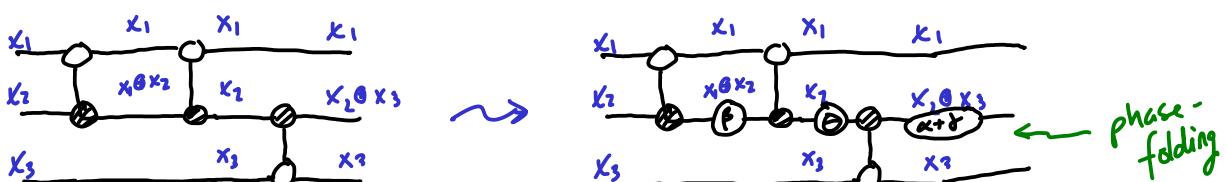

Q: Can we re-synthesise a circuit for (L, ϕ) ?

For L , we have:

To get ϕ , we need to place Z-phases on wires labelled:
 $x_2 \otimes x_3$, $x_1 \otimes x_2$, and x_2

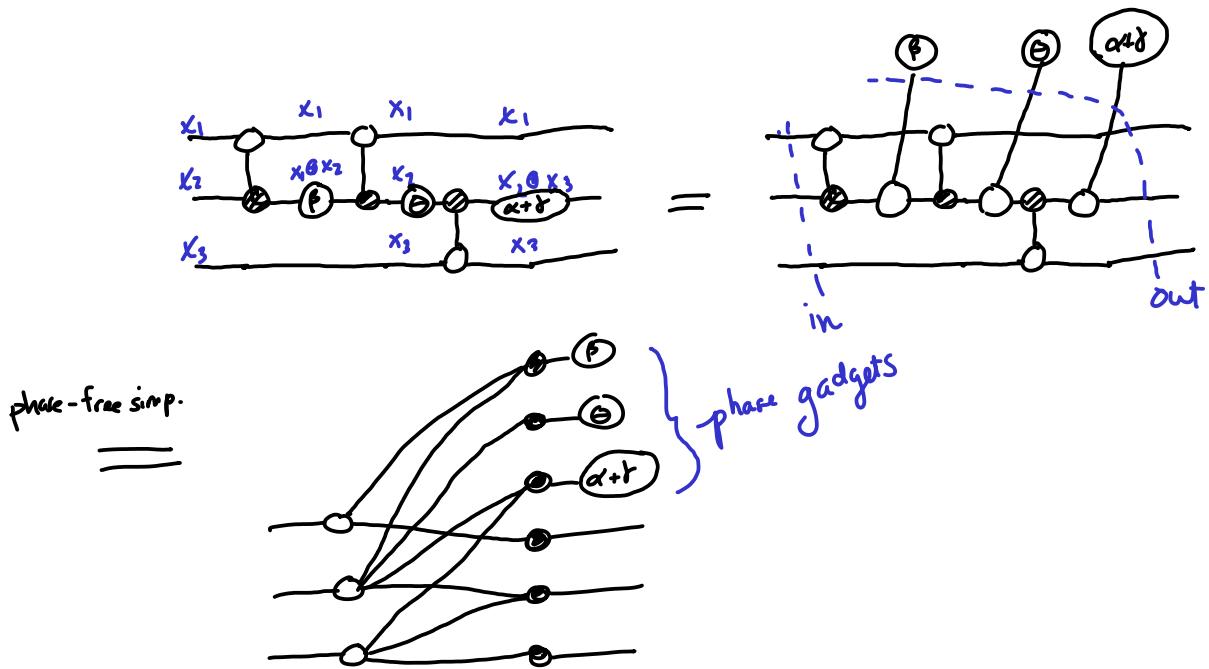

Only $x_1 \otimes x_2$ is missing, so let's (temporarily) create it:

Lecture 11

Phase polynomials, graphically (aka. phase gadgets)

Ex

1-legged:

$$\text{---} \alpha :: |x\rangle \mapsto \begin{cases} 1 & \text{if } x=0 \\ e^{i\alpha} & \text{if } x=1 \end{cases} = e^{i\alpha \cdot x}$$

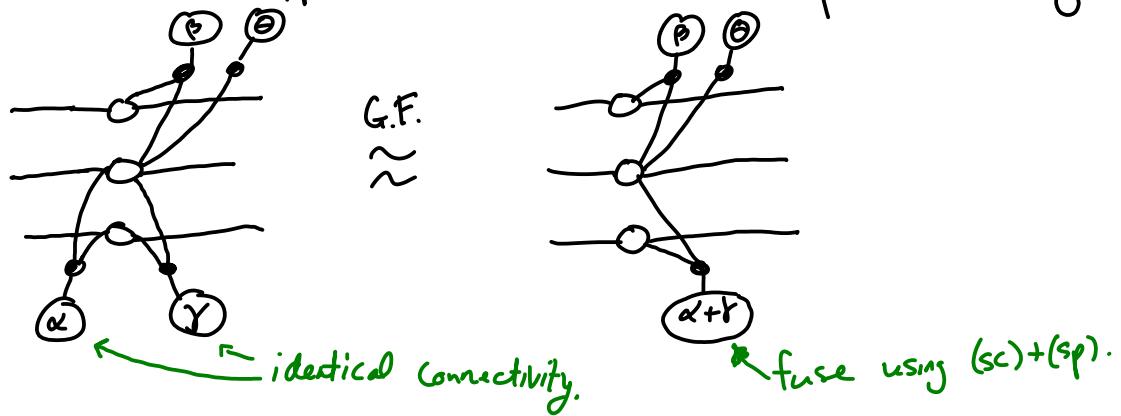

k -legged phase gadget:

$$\sqrt{2}^{(k-1)} \quad \text{---} \alpha :: |x_1 \dots x_k\rangle \mapsto e^{i\alpha \cdot (x_1 \oplus \dots \oplus x_k)}$$

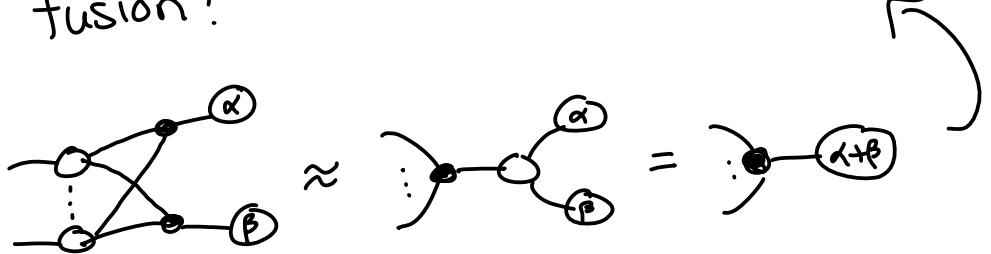

T_n a ^{diagonal} _{unitary}:

$$\sqrt{2}^{(k-1)} \quad \text{---} \alpha :: |x_1 \dots x_k\rangle \mapsto e^{i\alpha \cdot (x_1 \dots x_k)} |x_1 \dots x_k\rangle$$

Q: What happens when there is phase folding?

A: Gadget fusion!

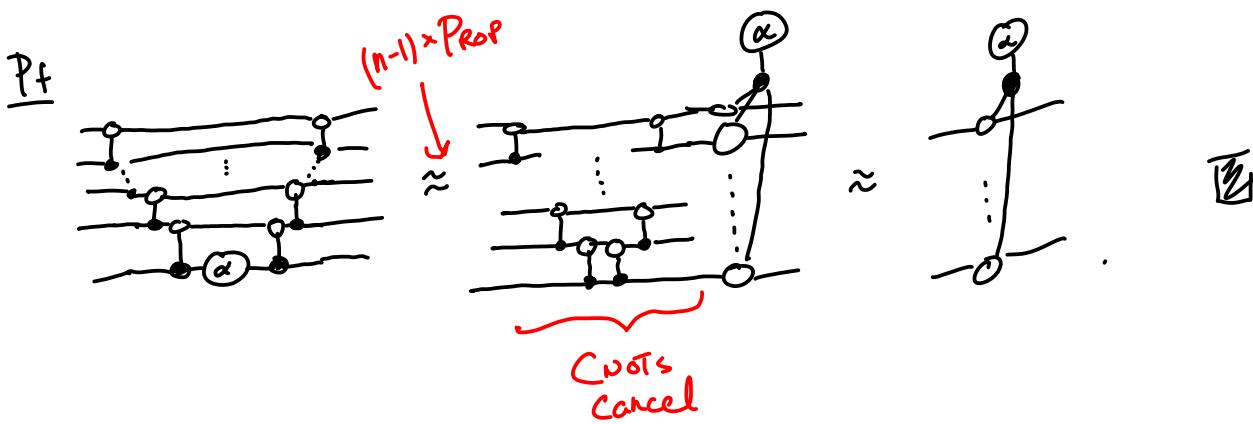

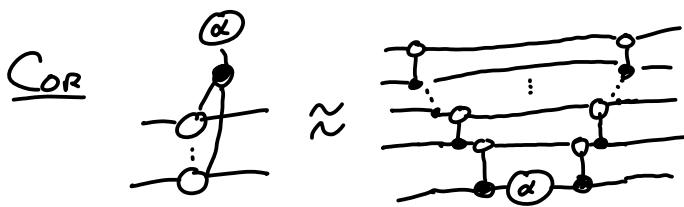

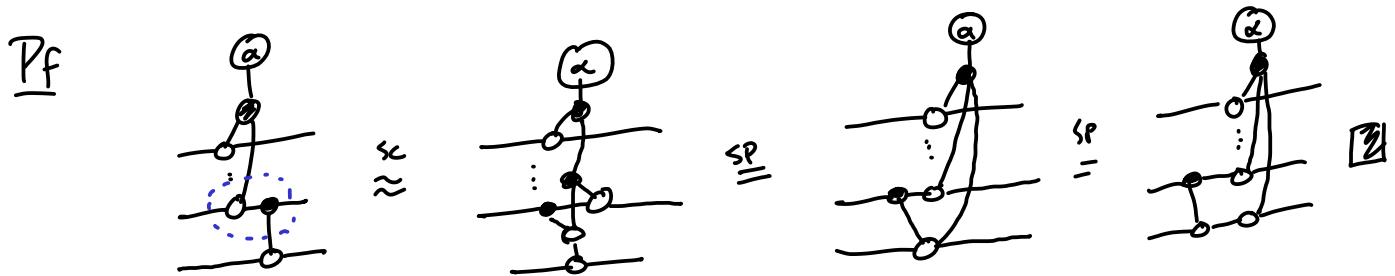

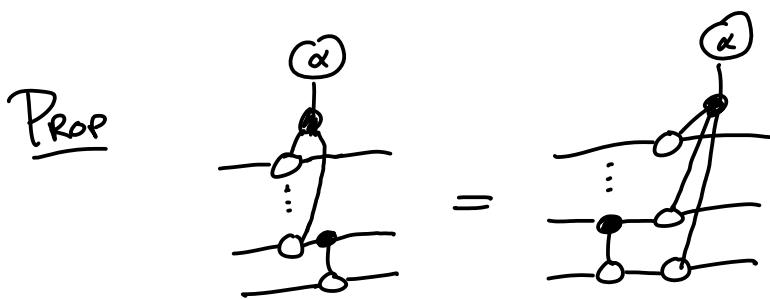

Algorithm: CNOT + phase optimisation.

1. unfuse phases and treat as outputs.
2. Compute PNF of phase-free part.
3. perform gadget fusion (* and other phase-poly reductions!)
- ?? → 4. extract a CNOT + phase circuit.

There are choices for step 4.

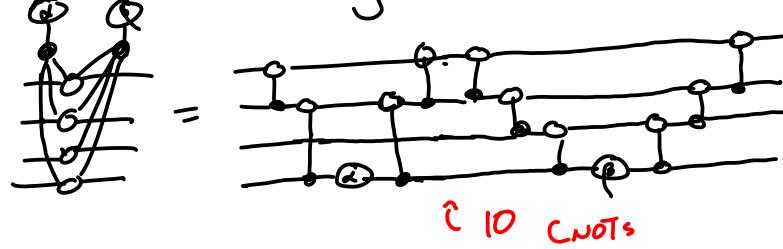

Naïve approach: "CNOT ladders"

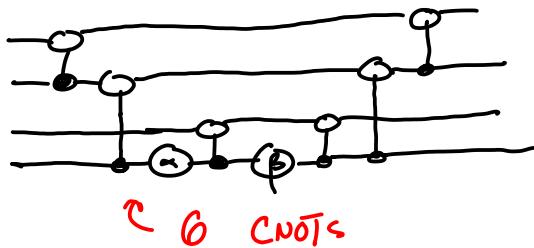

Näive extraction :

1. unfuse a phase gadget + replace using Cor 1.
2. repeat until no phase gadgets
3. synthesise CNOT circuit from phase-free diag.

* Lots of wasted CNOT gates! e.g.

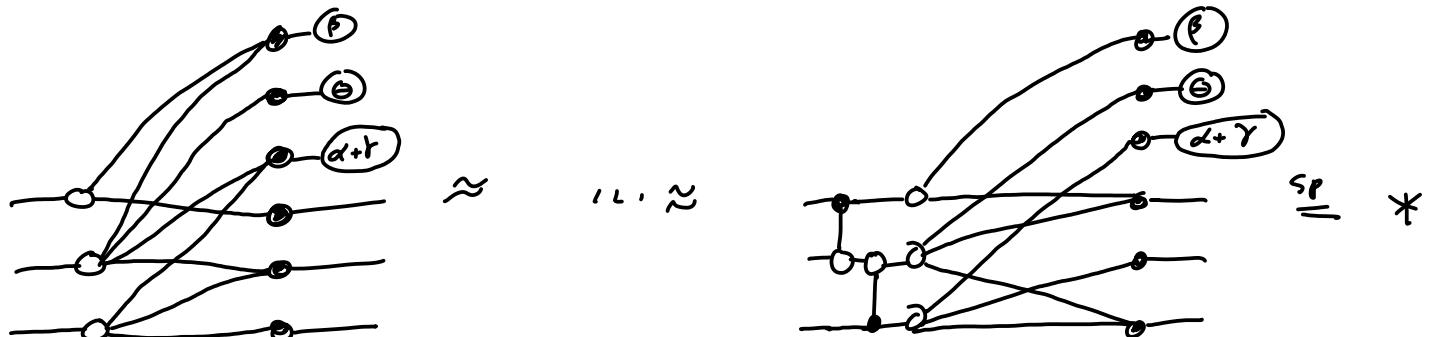

vs.

"T-par" style extraction [Amy, Maslov, Mosca 2013]

1. write an "extended biadjacency matrix"
2. identify a set of k linearly independent rows
3. reduce each row to a unit vector with column ops.
4. "extract phases" and repeat.

$$\begin{array}{l}
 \text{gadgets} \left\{ \begin{pmatrix} 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix} \right. \\
 \text{outputs} \left\{ \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 1 \end{pmatrix} \right. \\
 \xrightarrow{C_2 = C_2 + C_1} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 1 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix} \xrightarrow{C_2 = C_2 + C_3} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 1 \end{pmatrix}
 \end{array}$$

$$\begin{array}{l}
 * = \begin{array}{c} \text{circuit diagram} \\ \approx \end{array} \\
 \begin{pmatrix} 1 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 1 \end{pmatrix} \xrightarrow{C_2 = C_2 + C_1} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix} \xrightarrow{C_2 = C_2 + C_3} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix} \xrightarrow{C_3 = C_3 + C_2} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}
 \end{array}$$

Pro's: very good at low non-Clifford depth (i.e. layers of non-Cliff gates).

- gets better with ancillae!

Cons: • CNOT count/depth is inconsistent.

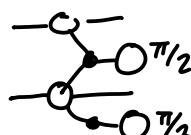

* Better for CNOT count: Gray-synth [Amy, Azimzadeh, Moscow 2017]

Lecture 12

High-level gates.

We've seen 2 kinds of phase polynomials:

"Multilinear" form, e.g.  $\therefore |x, y\rangle \mapsto e^{i\pi \cdot (\frac{1}{2}x + xy)} |x, y\rangle$

"XOR" form, e.g.  $\therefore |x, y\rangle \mapsto e^{i\pi \cdot (x \oplus y + y)} |x, y\rangle$
Phase-gadget

These two forms are related:

$$x \oplus y = x + y - 2xy \quad (x, y \in \{0, 1\})$$

↓
 XOR
 ↓ plus
 ↓ "correction"

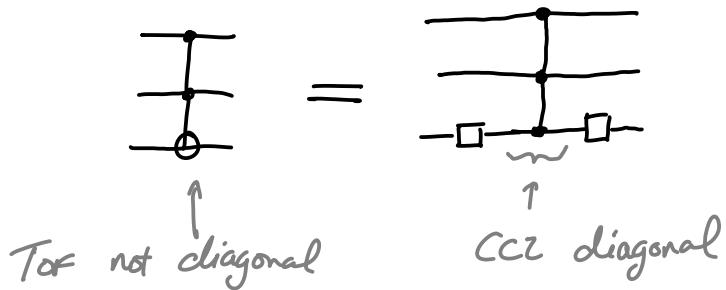

$$\begin{aligned} -2xy &= x \oplus y - x - y \\ \Rightarrow xy &= \frac{1}{2}(x + y - x \oplus y) \end{aligned}$$

$$\begin{aligned} \text{---} \circ \text{---} &\therefore |xy\rangle \mapsto e^{i\pi \cdot (xy)} |xy\rangle \\ &= e^{i\pi \left(\frac{1}{2}x + \frac{1}{2}y - \frac{1}{2}x \oplus y \right)} |xy\rangle \end{aligned}$$

$$\begin{array}{c} \text{---} \circ \text{---} \\ \approx \\ \text{---} \circ \text{---} \overset{\pi/2}{\circ} \text{---} \end{array} \quad \begin{array}{c} \text{---} \circ \text{---} \\ \approx \\ \text{---} \circ \text{---} \overset{\pi/2}{\circ} \text{---} \end{array} = \begin{array}{c} \text{---} \circ \text{---} \overset{\pi/2}{\circ} \text{---} \\ \approx \\ \text{---} \circ \text{---} \end{array}$$

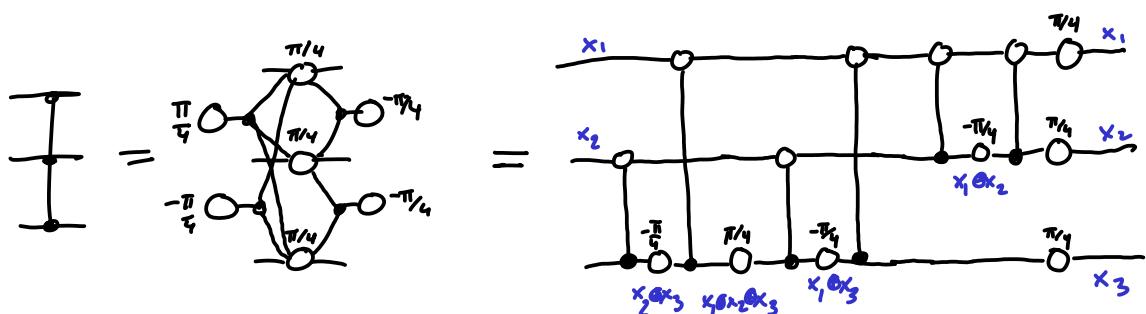

Some gates are easy to write in multilinear form.

Consider :

$$\begin{aligned} \text{CCZ } |x_1 x_2 x_3\rangle &= \begin{cases} |x_1 x_2 x_3\rangle & \text{if } x_1 \cdot x_2 = 0 \\ |x_1 x_2\rangle \otimes Z|x_3\rangle & \text{if } x_1 \cdot x_2 = 1 \end{cases} \\ &\quad \underbrace{\qquad\qquad}_{(-1)^{x_3}} \underbrace{|x_3\rangle}_{\text{ }} \\ &= (-1)^{x_1 x_2 x_3} |x_1 x_2 x_3\rangle = e^{i\pi \cdot x_1 x_2 x_3} |x_1 x_2 x_3\rangle \end{aligned}$$

$$\begin{aligned} X_1(x_2 x_3) &= \frac{1}{2} X_1 \cdot (X_2 + X_3 - X_2 \oplus X_3) \\ &= \frac{1}{2} (X_1 X_2 + X_1 X_3 - X_1 (X_2 \oplus X_3)) \\ &= \frac{1}{2} (X_1 + X_2 - X_1 \oplus X_2 + \cancel{X_1} + X_3 - X_1 \oplus X_3 - \cancel{X_1} - X_2 \oplus X_3 + X_1 \oplus X_2 \oplus X_3) \\ &= \frac{1}{2} (X_1 + X_2 + X_3 - X_1 \oplus X_2 - X_1 \oplus X_3 - X_2 \oplus X_3 + X_1 \oplus X_2 \oplus X_3) \end{aligned}$$

(see Nielsen+Chuang p.182)

Exercise: Why does N+C end up with an extra S gate?

Translation of CCZ into XOR form is a special case of discrete Fourier transform, i.e.

Prop For any function $\phi : \mathbb{F}_2^n \rightarrow \mathbb{R}$,

$$\phi(\vec{x}) = -\frac{1}{2^{n-1}} \sum_{\vec{y}} \tilde{\alpha}_{\vec{y}} (\vec{x} \cdot \vec{y})$$

where $\tilde{\alpha}_{\vec{y}} = \frac{1}{2^{n-1}} \sum_{\vec{z}} (-1)^{\vec{y} \cdot \vec{z}} \cdot \phi(\vec{y})$ are the Fourier coefficients.

In the CCZ case, taking the Fourier xform of $\phi(\vec{x}) = \begin{cases} 1 & \text{if } x_1x_2x_3 = 1 \\ 0 & \text{o.w.} \end{cases}$

gives:
$$\begin{cases} \tilde{\alpha}_{100} = \tilde{\alpha}_{010} = \tilde{\alpha}_{001} = \frac{1}{4} \\ \tilde{\alpha}_{110} = \tilde{\alpha}_{101} = \tilde{\alpha}_{011} = -\frac{1}{4} \\ \tilde{\alpha}_{111} = \frac{1}{4}. \end{cases}$$

This gives a general strategy for synthesising classical oracles.

1. Write:

$$\left| \begin{array}{c} \vdots \\ U_f \\ \vdots \end{array} \right\rangle = \left| \begin{array}{c} \vdots \\ D_f \\ \vdots \end{array} \right\rangle$$

$$D_f |\vec{x}, y\rangle := e^{i\pi \cdot \phi} |\vec{x}, y\rangle \quad \text{where } \phi(\vec{x}, y) = f(\vec{x}) \cdot y$$

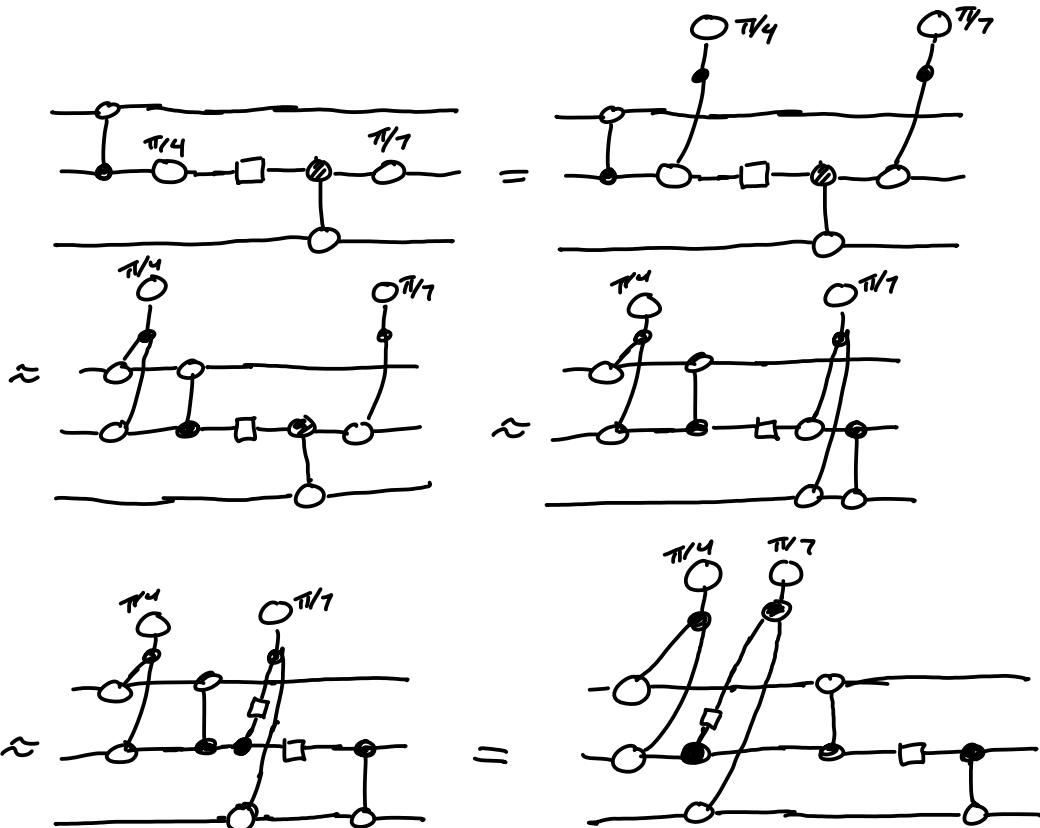

2. Compute Fourier coeffs of ϕ .

3. Synthesise D_f as CNOT+Phase circuit.

Pauli Gadgets

Clifford + Phase is a universal family.

Q: Can we move all the non-Clifford phases out?

H gates:

$$\text{---} \square \text{---} = \text{---} \square \text{---}$$

$$\text{---} \square \text{---} = \text{---} \square \text{---}$$

S gates:

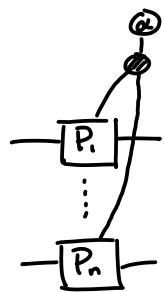

$$\text{---} \textcircled{\textstyle \frac{\pi}{2}} \text{---} = \text{---} \textcircled{\textstyle \frac{\pi}{2}} \text{---}$$

$$\text{---} \textcircled{\textstyle \frac{\pi}{2}} \text{---} = \text{---} \textcircled{\textstyle \frac{\pi}{2}} \text{---} \approx \text{---} \textcircled{\textstyle \frac{\pi}{2}} \text{---} \textcircled{\textstyle -\frac{\pi}{2}} \text{---} \textcircled{\textstyle -\frac{\pi}{2}} \text{---} \textcircled{\textstyle \frac{\pi}{2}} \text{---} \textcircled{\textstyle \frac{\pi}{2}} \text{---}$$

$$= \text{---} \textcircled{\textstyle -\frac{\pi}{2}} \text{---} \textcircled{\textstyle \frac{\pi}{2}} \text{---} \textcircled{\textstyle \frac{\pi}{2}} \text{---} \textcircled{\textstyle \frac{\pi}{2}} \text{---}$$

y

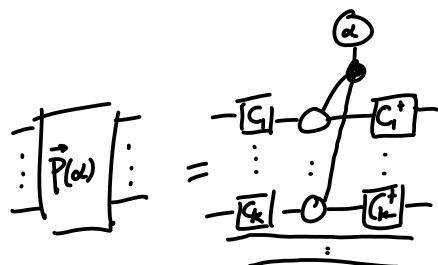

Prop For $\vec{P} = P_1 \otimes \dots \otimes P_n$ with $P_i \in \{I, X, Y, Z\}$ the map:

where: $\begin{cases} -\boxed{x} = -\text{σ}_x & -\boxed{y} = -\frac{1}{2}\text{i}\sigma_y \\ -\boxed{z} = -\text{σ}_z & -\boxed{I} = \text{I} \end{cases}$

is unitary. It is called the Pauli gadget $\vec{P}(\alpha)$.

Pf Note $-\boxed{x} = -\text{σ}_x = -\frac{1}{2}\text{i}\sigma_y$ and $-\boxed{y} = -\frac{1}{2}\text{i}\sigma_z$. So

for Cliff. unitaries C_i . Since phase gadgets are unitary, so is $\vec{P}(\alpha)$. \square

T_{Hm} Any Clifford+Phase circuit can be written as:

$$C = \vec{P}(\alpha_1) \cdots \vec{P}(\alpha_k) C'$$

\uparrow Clifford

Pf (Idea) • Show Pauli gadgets commute past all Clifford gates.

- Move phases out of C , one at a time. \square

Prop (Pauli gadget fusion.)

$$\begin{bmatrix} \vec{P}(\alpha) \\ \vdots \end{bmatrix} \begin{bmatrix} \vec{P}(\beta) \\ \vdots \end{bmatrix} = \begin{bmatrix} \vec{P}(\alpha+\beta) \\ \vdots \end{bmatrix}$$

Pf

$$\begin{bmatrix} \vec{P}(\alpha) \\ \vdots \end{bmatrix} \begin{bmatrix} \vec{P}(\beta) \\ \vdots \end{bmatrix} = \begin{array}{c} \textcircled{\alpha} \\ \textcircled{\beta} \end{array} \begin{array}{c} \textcircled{\alpha} \\ \textcircled{\beta} \end{array} \begin{array}{c} \textcircled{\alpha} \\ \textcircled{\beta} \end{array} \begin{array}{c} \textcircled{\alpha} \\ \textcircled{\beta} \end{array}$$

$$= \begin{array}{c} \textcircled{\alpha} \textcircled{\beta} \\ \textcircled{\alpha} \textcircled{\beta} \end{array} \begin{array}{c} \textcircled{\alpha} \\ \textcircled{\beta} \end{array} \begin{array}{c} \textcircled{\alpha} \\ \textcircled{\beta} \end{array} \stackrel{\text{phase gadget fusion}}{\approx} \begin{array}{c} \textcircled{\alpha+\beta} \\ \textcircled{\alpha+\beta} \end{array} \begin{array}{c} \textcircled{\alpha+\beta} \\ \textcircled{\alpha+\beta} \end{array} = \begin{bmatrix} \vec{P}(\alpha+\beta) \\ \vdots \end{bmatrix} \quad \blacksquare$$

Prop For Paulis \vec{P}, \vec{Q} if $\vec{P}\vec{Q} = \vec{Q}\vec{P}$, then $\vec{P}(\alpha)\vec{Q}(\beta) = \vec{Q}(\beta)\vec{P}(\alpha)$.

Pf Exercise, book (Hint: it's complementarity!)

Algorithm Pauli "phase folding".

1. Compute Pauli gadget form of a circuit.
2. Commute PG's and combine phases where possible.
3. Merge PG's with Clifford phases into the Clifford part.
4. Repeat until no more reductions.
5. Extract circuit.*

* like with CNOT+phase, there are many options.
