## LECTURE 6: INTRODUCTION TO FORMAL METHODS

Software Engineering Mike Wooldridge Lecture 6

Software Engineering

- they have a formal semantics;
- programs can be treated as mathematical theories.

Mike Wooldridge

Lecture 6

Software Engineering

## 1 What are Formal Methods?

• Formal methods is that area of computer science that is concerned with the application of mathematical techniques to the design and implementation of computer hardware and (more usually) software.

"That part of computer science concerned with the application of mathematical methods to the production of computer software". (Jones, 1986)

- Why bother with formal methods?
  - 1. The correctnesss problem:
    - producing software that is "correct" is famously difficult;
    - by using rigorous mathematical techniques, it may be possible to make *provably correct* software.
  - 2. Programs are mathematical objects;
    - they are expressed in a formal language;

Mike Wooldridge

Lecture 6

Software Engineering

- Diller (1988) suggests there are two main parts to formal methods:
  - Formal specification.
     Using mathematics to specify the desired properties of a computer system.
  - 2. Formal verification.
    Using mathematics to prove that a computer system satisfies its specification.
- To which many would add:
  - 3. Automated programming.

    Automating the process of program generation.

Lecture 6

Software Engineering

- The Z specification language is a semi-graphical notation for writing formal specifications.
- It was developed at Oxford University programming research group in the late 1970s.
- It has been adopted by IBM as their main formal specification tool (so it's not just an academic toy!)
- It was used to specify the IBM Customer Information Control System (CICS) — a major piece of software.

Mike Wooldridge

SOFTWARE TOOLS FOR Z

Lecture 6 Software Engineering

Lecture 6

Software Engineering

- There are at least three software tools for developing Z specifications:
  - **FUZZ**. Developed at Oxford by Spivey *et al*, in late 1980s.
  - CADIZ. Developed at York University, also in late 1980s (its what we have here);
  - ZED. Developed at Pennsylvania state University
