Mathematical Foundations of Programming Semantics XXXI
25 June 2015

UNIVERSITY OF
CAMBRIDGE

Computer Laboratory

ERC
European Research Council

Basic definitions

Inaccessible literature: filtered colimits, monadicity, locally presentable categories, adjoint functor theorems, Lawvere theories, . . .

satisfaction in a Σ -algebra, obtaining the notion of a (Σ, E) -algebra in C . This, with the evident definition of homomorphism of algebras, generates a category $(\Sigma, E)\text{-Alg}$ with a forgetful functor

$$U : (\Sigma, E)\text{-Alg} \longrightarrow C$$

which, if C is locally presentable, has a left adjoint F , inducing a monad $T = UF$ on C . The category $(\Sigma, E)\text{-Alg}$ is isomorphic to the category $T\text{-Alg}$ of algebras for the monad T .

– Plotkin and Power, “Notions of computation determine monads”, 1st paragraph after the introduction

and later: powers and copowers, enrichment, presheaf categories, sketches, Kan extensions, nerve and dense functors, . . .

Accessible semantics of algebraic effects

Roadmap: syllabus for graduate students

(Cambridge Computer Science MPhils)

Setting: target audience

Course format

Lecture class (9 lectures = 2 per week \times 4 $\frac{1}{2}$ weeks)

50 minute lectures

(7 more lectures with Marcelo Fiore on abstract syntax with binding)

Attendees

5 students taking the class

2 students sitting in

5 PhDs and Postdocs

Not in this talk:

Evaluation, course material, pedagogy
(course under development!)

Work within and around **Set**

Keep (categorical) concepts concrete.
Rich toolkit (e.g., equational logic).

Focus on *semantics*, not categories

Rich categorical picture.
Maintain a computer science connection.

Convey semantic intuition

Obscured by mathematical apparatuses in literature.
Offer vantage points.

Secret to success: prerequisites

Andy Pitts

'Category Theory and Logic' module:

- ▶ categories
- ▶ products and equational logic
- ▶ exponentials, typed λ -calculus and CCCs
- ▶ functors
- ▶ naturality
- ▶ presheaves
- ▶ Yoneda
- ▶ pullbacks
- ▶ adjunctions

No domain theory!

as not taught everywhere :(

Syllabus

1. Pure λ -calculus
2. Moggi's λ_c
3. Equational logic, universal algebra, and monads
4. Model construction
5. Language design
6. Effect combination
7. Type-and-effect systems
8. Effect handlers
9. Programmable handlers

Starting point

Simply-typed λ -calculus with sum types

Semantic concepts

- ▶ Equational theory
- ▶ CBV Felleisen SOS
- ▶ Denotational semantics
- ▶ Adequacy proof

Rationale

- ▶ Mostly familiar
- ▶ Align baseline
- ▶ Modular logical relations

Categorical concepts

- ▶ Distributive categories, bi-CCCs
- ▶ A category for logical relations

Syllabus

1. Pure λ -calculus
2. Moggi's λ_c
3. Equational logic, universal algebra, and monads
4. Model construction
5. Language design
6. Effect combination
7. Type-and-effect systems
8. Effect handlers
9. Programmable handlers

Moggi's λ_c

Semantic concepts

- ▶ Failure of equational theory
- ▶ Adequacy and the mono requirement
- ▶ Lack of general SOS

Rationale

- ▶ Most have heard about Moggi/monads
- ▶ First brush against open problems

Categorical concepts

- ▶ Strong monads
- ▶ Lifting of a monad
- ▶ Hermida's lifting

Syllabus

1. Pure λ -calculus
2. Moggi's λ_c
3. Equational logic, universal algebra, and monads
4. Model construction
5. Language design
6. Effect combination
7. Type-and-effect systems
8. Effect handlers
9. Programmable handlers

Algebraic interlude

Semantic concepts

- ▶ Computational models
 - ▶ exceptions
 - ▶ non-determinism
 - ▶ mnemoids

$$\begin{array}{c} \text{update}_b \\ | \\ \text{lookup} \\ / \quad \backslash \\ x_0 \quad x_1 \end{array} = \begin{array}{c} \text{update}_b \\ | \\ x_b \end{array}$$

- ▶ Presentation sensitivity

$$\begin{array}{c} \text{tns}_b \\ / \quad \backslash \\ \text{tns}_0 \quad \text{tns}_1 \\ / \quad \backslash \quad / \quad \backslash \\ x_0 \quad x_1 \quad x_0 \quad x_1 \end{array} = x_b$$

test and set algebras

Mathematical concepts

- ▶ Review eq. logic
- ▶ Universal algebra
- ▶ Free model monad
- ▶ Unranked monads:
Powerset, continuations

Rationale

- ▶ Effects as algebraic operations
- ▶ Algebraic manipulation of monads
- ▶ Limitations (rank)

Syllabus

1. Pure λ -calculus
2. Moggi's λ_c
3. Equational logic, universal algebra, and monads
4. Model construction
5. Language design
6. Effect combination
7. Type-and-effect systems
8. Effect handlers
9. Programmable handlers

Abstract device driver interaction

Semantic concepts

- ▶ Interface: $lookup : |State|$,
 $act_m : 1$
- ▶ Equations:

$$\begin{array}{ccc} act_{m_1} & & \\ | & & \\ act_{m_2} = & act_{m_1 \cdot m_2} & \\ | & | & \\ x & x & \end{array}$$

- ▶ How to choose the right monad?

Mathematical concepts

- ▶ Hilbert-Post completeness
- ▶ Monad calculation
 $\prod_{s \in State} sM \times -$
- ▶ Monoid actions + orbits as abstract automata

Rationale

- ▶ Non-obvious monad
- ▶ Open problem: model construction

Syllabus

1. Pure λ -calculus
2. Moggi's λ_c
3. Equational logic, universal algebra, and monads
4. Model construction
5. Language design
6. Effect combination
7. Type-and-effect systems
8. Effect handlers
9. Programmable handlers

Algebraic language design

λ_{alg} : Algebraic lambda calculus

Semantics concepts

- ▶ λ_c + Kleisli arrows
 $a \rightarrow Tb$
- ▶ A closed language
- ▶ No SOS still

Rationale

- ▶ Semantically motivate (continuation-based) alg. operations
- ▶ General metalanguage for effects

Categorical concepts

- ▶ Mention $\top\top$ -lifting [Katsumata'05,'11]
- ▶ Algebraic lifting [Kammar'14]
- ▶ Generic effects and alg. operations $(TX)^b \rightarrow (TX)^a$

Syllabus

1. Pure λ -calculus
2. Moggi's λ_c
3. Equational logic, universal algebra, and monads
4. Model construction
5. Language design
- 6. Effect combination**
7. Type-and-effect systems
8. Effect handlers
9. Programmable handlers

Algebraic effect combination

Sum and tensor

Semantic concepts

- ▶ Modular model/program construction
- ▶ Monad transformers composition order
- ▶ Graph tool

Rationale

- ▶ Still an open problem
- ▶ Haskell-relevant

Mathematical concepts

- ▶ Monads don't compose, e.g.:

$$\left((1 + 1) \times (-) \right) \circ (X \mapsto 1)$$

is NaM (ta Conor)

- ▶ Monad transformers
- ▶ Sum and tensor
- ▶ Cographs

Syllabus

1. Pure λ -calculus
2. Moggi's λ_c
3. Equational logic, universal algebra, and monads
4. Model construction
5. Language design
6. Effect combination
7. **Type-and-effect systems**
8. Effect handlers
9. Programmable handlers

Type-and-effect systems

Semantic concepts

- ▶ Syntax and semantics
- ▶ Model generation
- ▶ Compiler transformation validation (soundness and completeness)

Rationale

- ▶ Solve an open problem
- ▶ Application area outside den. sem.
- ▶ For programmable handlers

Mathematical concepts

- ▶ Monad morphisms
- ▶ Conservative extension/restriction
- ▶ Application to algebraic lifting

$$\begin{array}{ccc} & (State \times -)^{State} & \\ & \downarrow & \\ & (State \times -)^{State} & \\ \swarrow & & \nwarrow \\ (-)^{State} & & (1 + State) \times - \\ \swarrow & \text{id} & \nwarrow \end{array}$$

Syllabus

1. Pure λ -calculus
2. Moggi's λ_c
3. Equational logic, universal algebra, and monads
4. Model construction
5. Language design
6. Effect combination
7. Type-and-effect systems
8. Effect handlers
9. Programmable handlers

Semantics for effect handlers

Semantic concepts

- ▶ 'handle' is not an alg. op.
- ▶ λ_{alg} + fixed set of handlers
- ▶ equational laws for handlers [Plotkin & Pretnar'09]

$$\begin{array}{ccc} U(TA, \mu) & & \\ \eta \uparrow & \text{handle} - \text{with } h \text{ in } f & \text{---} \\ & = & \\ A & \xrightarrow{f} & U(H, h) \end{array}$$

Categorical concepts

- ▶ Algebras and homomorphisms for a monad

Rationale

- ▶ Incorporate exception handlers
- ▶ Handle non-free effects
- ▶ Possible for unranked monads

Syllabus

1. Pure λ -calculus
2. Moggi's λ_c
3. Equational logic, universal algebra, and monads
4. Model construction
5. Language design
6. Effect combination
7. Type-and-effect systems
8. Effect handlers
9. Programmable handlers

Programmable handlers

- ▶ λ_{eff} : user-defined alg. effects and handlers
- ▶ operational and denotational semantics
- ▶ programming examples

Rationale

- ▶ Synthesises:
 - ▶ (free) theories
 - ▶ effect systems
 - ▶ effect handlers,
 - ▶ algebraic lifting (for adequacy)
- ▶ “Hot” and active research topic

Conclusion

- ▶ A graduate-level syllabus
- ▶ Gateway to more advanced mathematical concepts
- ▶ Fits in half a lecture course (9 lectures), can co-exist with broader context (e.g., recursive domain equations).
- ▶ Inconclusive success (still under development)

Further work

- ▶ Course material, e.g.:
 - lecture notes
 - exercises
- ▶ Pedagogy

Syllabus

1. Pure λ -calculus
2. Moggi's λ_c
3. Equational logic, universal algebra, and monads
4. Model construction
5. Language design
6. Effect combination
7. Type-and-effect systems
8. Effect handlers
9. Programmable handlers
