

# Axiomatizing complete positivity

Oscar Cunningham and Chris Heunen

*{oscar.cunningham, heunen}@cs.ox.ac.uk*

July 16, 2015

- Model quantum mechanics by **FdHilb** (Dagger Compact Symmetric Monoidal Category)
- Can model mixed states in two ways
  - $\text{CPM}[\mathbf{FdHilb}]$ : Same objects, morphisms are completely positive maps.
  - $\text{CP}^*[\mathbf{FdHilb}]$ : Category of  $C^*$ -algebras and completely positive maps.
- Generalises to functors  $\text{CPM}, \text{CP}^* : \mathbf{DCSMC} \rightarrow \mathbf{DCSMC}$ .
- Canonical inclusions  $\mathbf{C} \hookrightarrow \text{CPM}[\mathbf{C}] \hookrightarrow \text{CP}^*[\mathbf{C}]$
- Question: When is  $\mathbf{D}$  equal to some  $\text{CPM}[\mathbf{C}]$  or  $\text{CP}^*[\mathbf{C}]$ ?

Diagram

Example: **FdHilb**

Object:

Finite-dim Hilbert space  $A$

$B$

Morphism:

Linear map  $f : A \rightarrow B$

$C$

Composition:

Composition of linear maps

# Symmetric Monoidal Categories

Monoidal product:

Tensor product  $A \otimes A'$

On morphisms:

$f \otimes g$

Swap:

Canonical map  $A \otimes A' \rightarrow A' \otimes A$

# Compact Monoidal Categories

Dual object:

Dual vector space  $A^*$

Cup:

$\mathbb{C} \rightarrow \text{End}(A) \cong A \otimes A^*$

$z \mapsto zI$

Cap:

Trace:  $A^* \otimes A \cong \text{End}(A) \rightarrow \mathbb{C}$

Can define transpose:

denoted as

# Dagger Categories

Dagger:  $\begin{array}{c} B \\ | \\ \boxed{f} \\ | \\ A \end{array} \mapsto \begin{array}{c} A \\ | \\ \boxed{f} \\ | \\ B \end{array}$   $f^\dagger$  s.t.  $\langle fv, w \rangle = \langle v, f^\dagger w \rangle$

Gives a contravariant functor:  $\begin{array}{c} C \\ | \\ \boxed{g} \\ | \\ \boxed{f} \\ | \\ A \end{array} \mapsto \begin{array}{c} A \\ | \\ \boxed{f} \\ | \\ \boxed{g} \\ | \\ C \end{array}$

Hence have all four orientations:

Original    Transpose    Adjoint    Conjugate

# Density Matrices

In QM, mixed states are given by positive matrices:

These correspond to states of  $A^* \otimes A$ :

Generalising this, the Choi-Jamiolkowski isomorphism says that the completely positive maps are precisely the ones of the form:

# The CPM construction

(P. Selinger **Dagger Compact Closed Categories and Completely Positive Maps**)

$CPM[\mathbf{D}]$  has objects  $ob(\mathbf{D})$

Morphisms  $A \rightarrow B$  are

$D$  embeds into  $CPM[\mathbf{D}]$  by

Question: Given  $\mathbf{C}$ , when is  $\mathbf{C} \sim CPM[\mathbf{D}]$  for some  $\mathbf{D}$ ?

Consider functors between  $\mathbf{C}$  and  $\mathbf{CPM}[\mathbf{C}^{\text{pure}}]$  given by

("Folding in half")

The axioms are precisely what is needed to prove that these are well defined DCSM-functors. They are clearly inverse to each other.

A *special dagger Frobenius structure* is an object  $A$  equipped with morphisms  $\circlearrowleft: A \otimes A \rightarrow A$  and  $\circlearrowright: I \rightarrow A$  satisfying:

The special dagger Frobenius structures in **FdHilb** correspond precisely to the finite dimensional  $C^*$ -algebras. (B. Coecke et al. **Categories of Quantum and Classical Channels**)

# Completely positive maps

(Shorthand: Write  for , and  for .)

A state is positive when it is of the form:

Generalising this, a morphism is completely positive when it is of the form:

# The CP\* construction

$\text{CP}^*[\mathbf{D}]$  has as objects the special dagger Frobenius algebras  $(A, \uparrow, \downarrow)$  in  $\mathbf{D}$

Morphisms  $(A, \uparrow, \downarrow) \rightarrow (B, \uparrow, \downarrow)$  are

$\mathbf{D}$  embeds into  $\text{CP}^*[\mathbf{D}]$  by

$$A \longmapsto (A \otimes A^*, \uparrow, \downarrow, \downarrow, \uparrow)$$

Problem: We can't talk about  $\text{tr}$  in  $\text{CP}^*[\mathbf{D}]$  because it isn't itself a completely positive map (from  $(A \otimes A, \text{tr} \otimes \text{tr}, \text{tr})$  to  $(A, \text{tr}, \text{tr})$ )

Idea:  $\text{tr}$  is completely positive when considered as going from  $(A \otimes A^*, \text{tr} \otimes \text{tr}, \text{tr})$  to  $(A, \text{tr}, \text{tr})$ .

Answer:

## Theorem

Suppose  $\mathbf{C}$  has a subcategory  $\mathbf{C}^{pure}$  and

- for each object  $A \in \mathbf{C}^{pure}$  we have specified a morphism  $\ddagger : A \rightarrow I$ ,
- for each special dagger Frobenius algebra  $\mathcal{A} = (A, \rho, \circlearrowleft, \circlearrowright)$  in  $\mathbf{C}^{pure}$  we have specified an object  $F_{\mathcal{A}} \in \mathbf{C}$  and a map  $\uparrow : A \rightarrow F_{\mathcal{A}}$ .

If the following axioms are satisfied then  $\mathbf{C} \sim \text{CP}^*[\mathbf{C}^{pure}]$

$$\begin{array}{c} \text{---} \\ \text{---} \\ \text{---} \\ | \\ A \otimes C \end{array} = \begin{array}{c} \text{---} \\ \text{---} \\ | \\ A \end{array} \begin{array}{c} \text{---} \\ \text{---} \\ | \\ C \end{array} \quad \text{and} \quad \begin{array}{c} \text{---} \\ \text{---} \\ | \\ I \end{array} = \quad \text{and} \quad \begin{array}{c} \text{---} \\ \text{---} \\ | \\ A \end{array} = \begin{array}{c} \text{---} \\ \text{---} \\ | \\ A \end{array} \begin{array}{c} \text{---} \\ \text{---} \\ | \\ \text{---} \\ \text{---} \\ \text{---} \end{array} \quad (1)$$

$$\begin{array}{c} \downarrow \\ \text{---} \\ \text{---} \\ \text{---} \\ | \\ f \end{array} \begin{array}{c} \uparrow \\ \text{---} \\ \text{---} \\ | \\ f \end{array} = \begin{array}{c} \downarrow \\ \text{---} \\ \text{---} \\ \text{---} \\ | \\ g \end{array} \begin{array}{c} \uparrow \\ \text{---} \\ \text{---} \\ | \\ g \end{array} \quad \text{iff} \quad \begin{array}{c} \text{---} \\ \text{---} \\ | \\ f \end{array} = \begin{array}{c} \text{---} \\ \text{---} \\ | \\ g \end{array} \quad \text{for } f, g \in \mathbf{C}^{\text{pure}} \quad (2)$$

$$\begin{array}{c} F_{A \otimes B} \\ \text{---} \\ \text{---} \\ \text{---} \\ | \\ A \otimes B \end{array} = \begin{array}{c} F_A \quad F_B \\ \text{---} \quad \text{---} \\ \text{---} \quad \text{---} \\ | \quad | \\ A \quad B \end{array} \quad \text{and} \quad \begin{array}{c} F_I \\ \text{---} \\ | \\ I \end{array} = \quad (3)$$

$$\begin{array}{c} \uparrow \\ \text{---} \\ \text{---} \\ \text{---} \\ | \\ \text{---} \\ \text{---} \\ \text{---} \\ | \\ \uparrow \end{array} = \begin{array}{c} \text{---} \\ \text{---} \\ | \\ \text{---} \\ \text{---} \\ \text{---} \\ | \\ \uparrow \end{array} \quad \text{and} \quad \begin{array}{c} \uparrow \\ \text{---} \\ \text{---} \\ \text{---} \\ | \\ \text{---} \\ \text{---} \\ \text{---} \\ | \\ \uparrow \end{array} = \begin{array}{c} \text{---} \\ \text{---} \\ | \\ \text{---} \\ \text{---} \\ \text{---} \\ | \\ \uparrow \end{array} \quad (4)$$

For all  $f \in \mathbf{C}$  we have  $g \in \mathbf{C}^{\text{pure}}$  such that

$$\begin{array}{c} | \\ \text{---} \\ \text{---} \\ | \\ f \end{array} = \begin{array}{c} \text{---} \\ \text{---} \\ | \\ \text{---} \\ \text{---} \\ \text{---} \\ | \\ \text{---} \\ \text{---} \\ | \\ \text{---} \\ \text{---} \\ | \\ g \end{array} \quad (5)$$

The isomorphism is
