

Fun with  
First-Class

Datatypes

Conor McBride  
University of  
Strathclyde

further proletarian adventures. . .

... in the post-revolutionary workers' republic

Dependent types allow  
data and computation  
in types.

This is terrifying...

Dependent types allow  
**data** and **computation**  
in **types**.

This is **terrifying**,  
**exhilarating**, **liberating**,  
**powerful** and **strongly normalizing**.

a term goes to a shop where he knows adventures can begin

as if by magic, the shopkeeper appears

the term goes into the fitting room. . .

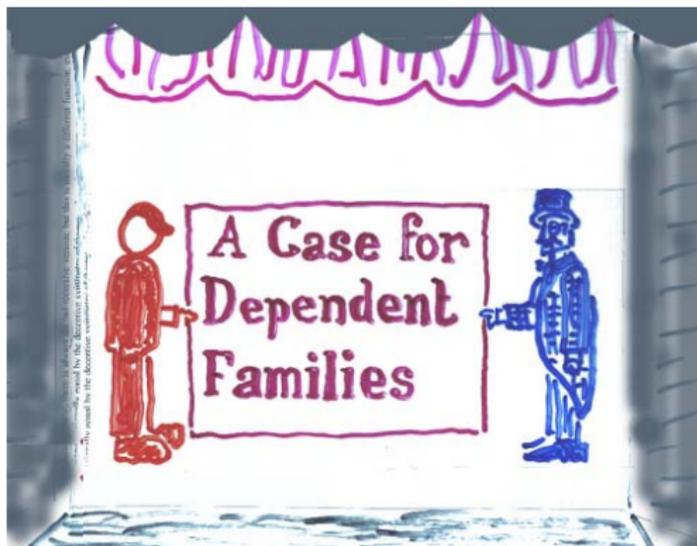

... and tries on the clothes; they fit perfectly

## universe constructions

- we may define a datatype  $U : \text{Type}$  containing **names** of **types** ...
- ... and a family  $T : U \rightarrow \text{Type}$ ,  $T u$  containing the **data** for the type with name  **$u$**
- we can write **generic** programs over arbitrary  $T u$
- we can calculate  **$u$ 's** without adding any 'new' notion of computation

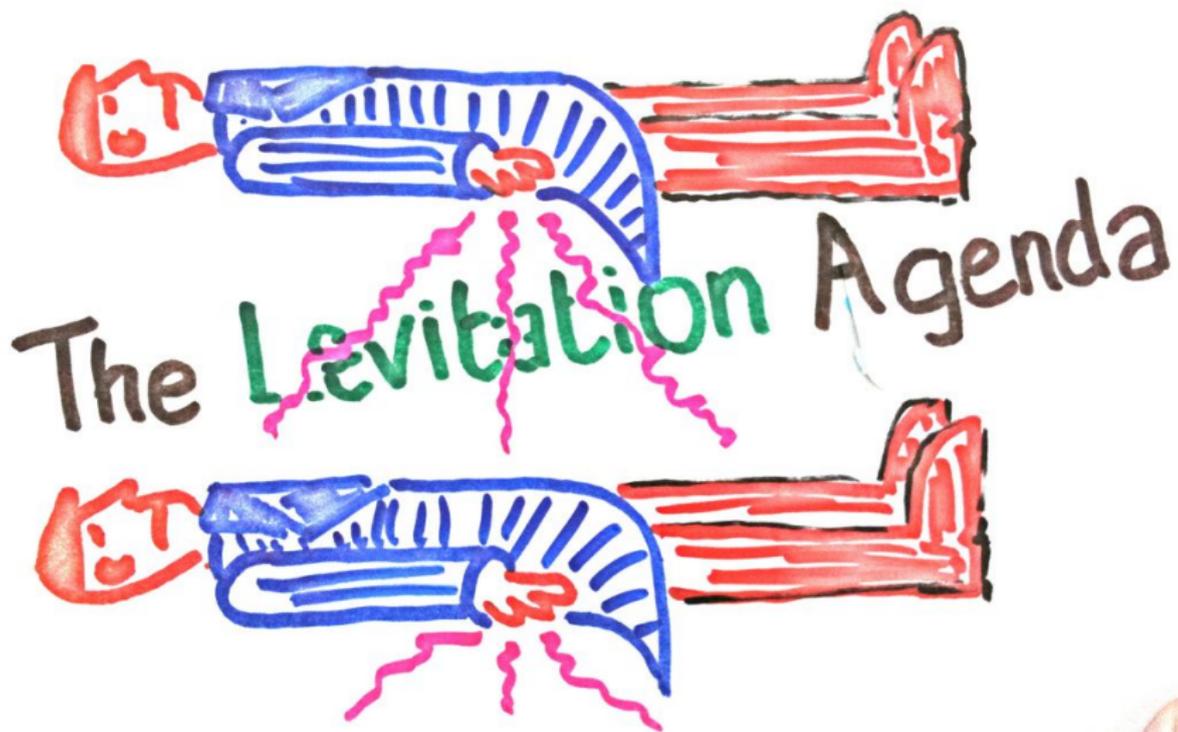

slides from a talk I gave in Edinburgh in 2000

more later...](http://strictlypositive.org/a-case-more-later...)

## Universes of datatypes:

- ▶ P Dybjer, A Setzer *A finite axiomatization of inductive-recursive denitions*. TLCA 1999
- ▶ C McBride *The derivative of a regular type is its type of one-hole contexts* Rejected, LICS 2001
- ▶ T Altenkirch, C McBride *Generic programming within dependently typed programming* Generic Programming 2002
- ▶ M Benke, P Dybjer, P Jansson *Universes for generic programs and proofs in dependent type theory* Nord. J. Comp. 2003
- ▶ W Verbruggen, E de Vries, A Hughes *Polytypic programming in Coq* WGP 2008
- ▶ P Morris, T Altenkirch, N Ghani *A universe of strictly positive families* IJCS 2009
- ▶ J Chapman, P-E Dagand, C McBride, P Morris **The Gentle Art of Levitation** ICFP 2010

- construct  $\mathbb{F}_n : \text{Set}_n \rightarrow \text{Set}_{n+1}$

$[-] : \mathbb{F}_n I \rightarrow (I \rightarrow \text{Set}_n) \rightarrow (I \rightarrow \text{Set}_n)$

└ endofunctor

- abolish datatypes, except

$\mu_n : \mathbb{F}_n I \rightarrow I \rightarrow \text{Set}_n$

$\langle - \rangle : [-] (\mu F) \xrightarrow{\text{pointwise } \rightarrow} \mu F$

- $\mu_n F$  has a recursor
- $\mathbb{F}_n$  is defined using  $\mu_{n+1}$ ,  
ie. coded via  $\mathbb{F}_{n+1}$
- recursor for  $\mu_{n+1}$  gives  
'generic' programming for  $\mu_n$  types
- let's code up one layer in Agda

Here goes nothing.

generic programs

- map and fold
- substitution induces isomorphism
- differential calculus
- and ...

Here goes more nothing.

two more frames from '00

list A I won't tell if there's a tail

- introduction

$$\frac{}{\text{nil} : \text{list } A} \quad \frac{x : A \quad \text{xs} : \text{list } A}{\text{cons } x \text{ xs} : \text{list } A}$$

- elimination

$$\Phi : \text{list } A \rightarrow \text{Type}$$

$$\text{listElim} \frac{\Phi \text{ nil} \quad \frac{x : A \quad \Phi \text{ xs}}{\Phi (\text{cons } x \text{ xs})}}{\forall \text{xs} : \text{list } A. \Phi \text{ xs}}$$

- example

$$\begin{array}{l} \text{tail} : \text{list } A \rightarrow \text{list } A \\ \text{tail} \quad (\text{cons } x \text{ xs}) = \text{xs} \\ \text{tail} \quad \text{nil} = \text{error} \end{array}$$

vect A n I know my own length

- introduction

$$\frac{}{\text{vnil} : \text{vect } A \ 0} \quad \frac{x : A \quad \text{xs} : \text{vect } A \ n}{\text{vcons } x \ \text{xs} : \text{vect } A \ (n+1)}$$

- elimination

$$\Phi : \forall n : \mathbb{N}. \text{vect } A \ n \rightarrow \text{Type}$$

$$\text{vectElim} \frac{\Phi \ 0 \ \text{vnil} \quad \frac{x : A \quad \Phi \ n \ \text{xs}}{\Phi \ (n+1) \ (\text{vcons } x \ \text{xs})}}{\forall n : \mathbb{N}. \forall \text{xs} : \text{vect } A \ n. \Phi \ n \ \text{xs}}$$

- example

$$\begin{array}{l} \text{vtail} : \forall n : \mathbb{N}. \text{vect } A \ (n+1) \rightarrow \text{vect } A \ n \\ \text{vtail} \quad (\text{vcons } x \ \text{xs}) = \text{xs} \end{array}$$

a suggestive overlay — can we formalize it?

vec n { I know my own length }

v vec 0 v      vec n  
vec (sn)

$\forall n:\mathbb{N}. \text{vec } n$

vec      0 v      n  
            (sn) v  
 $\forall n:\mathbb{N}. \text{vec } n \ n$

v  $\forall n:\mathbb{N}. \text{vec } (sn) \ \text{vec } n$   
v      v

ornaments  
and their  
algebras  
and their  
ornaments

Here goes even more nothing.

abolish data declaration;  
point out the structure  
which induces the function  
abstract and delete
